Thread: [VB.NET] Help with changing file extension

Dushidude - *July 16, 2017, 4:48 am*

I need help to make a code which gets the file extension from a specific path, and then changes it to a new file extension. For example from .txt to .pdf. The file extension can be random, so the code has to find out what the extension is.

Washi - *July 16, 2017, 5:00 am*

Have a look at the Path.ChangeExtension(String, String) and File.Move(String, String) methods. Combined they do exactly what you need.

zeroexp - *July 16, 2017, 5:01 am*

Here's all you have to know, although your threads are very fucking sketchy so I won't give you any code.

Path.GetExtension
Path.GetFileNameWithoutExtension
Path.GetDirectoryName
System.IO.File.Move
System.IO.File.Delete

Alternatively you can use ChangeExtension as said by Washi but I never tried it before so constructing the path based on the first 3 methods is what I recommend.

Do not spoon feed this one, he's up to no good lads. (check his threads, you'll see what i mean)

darkdoctor - *July 16, 2017, 8:00 am*

In c# you can simply rename the file .

```
string fileName = Path.GetFileName(path);
string ext = Path.GetExtension(path);
string newFileName = fileName + Reverse(ext);

File.move(path,newFileName);
```

Should be closed and not banned
His thread were literally:
How to spread
How to encrypt files
How to changeextension.
For sure not ransomware
