Thread: MouseListener for all actions?

Loses - *September 8, 2017, 3:12 pm*

Basically I want to make a quick program personally that uses hotkeys, so if I click mouse_3 I want it to type something specific. I don't want it to be bounded to any particular jframe I want it to work if I was making a post like on here.

Any direction would be appreciated, from what I know about mouselisteners is that they're usually binded to a JFrame of some sorts.

I don't think keyboard hooks are natively supported in the JVM.

https://en.wikipedia.org/wiki/Java_Native_Interface
https://msdn.microsoft.com/en-us/library/windows/desktop/ms644990(v=vs.85).aspx

Code WH_KEYBOARD_LL

Use a different language. AutoIt comes to mind

This.
Or if you're keen on using Java, another alternative is using JNI/JNA and learn to write some C code :P

Dezzz - *September 9, 2017, 6:49 pm*

If you want to hook all input events without doing some sort of overlay or having the events register thru your program you're gonna need to use JNA
https://github.com/java-native-access/jna

You're much better off doing it in another language tho
It's just gonna be a bitch to work with native stuff in java like that

Why on earth would you want to even touch Java if you need C? >_>
