Thread: Hacking with ipod,ipad,iphone and Samsung galaxy 2-5

Eazzy - *June 11, 2014, 1:08 pm*
Is there anyway to do so? i was wanting to lets say be beside someone and download their files on their phone and connect to any wifi,hack or DOS while i am on the go or something?stuff like that. NO i don't mean like watchdogs cause that shit is fake but i really want to do this. I have everything listed in the title and i might get the samsung s5 watch thing and would be cool if i can hack with that too :P Thanks you for reading!

Please don't post if you are gonna say something rude...
Please post if you can help me tho :3

No, I do not belive that something like that is possible. It would be too similar to Watch Dogs.

Ok is there anyway i can hack wifi and such? also what if i RAT their phone?

Linker - *June 11, 2014, 1:11 pm*
I have never found a way to do so, unless I had some sort of access directly to their phone/device. Especially if you were in a public area with many people, it may be difficult to distinguish who is who sense iPhones are almost everywhere now adays. So sorry, I have no clue man, good luck!

Misunderstood your oh-so-well-written post, sorry.

These devices are nothing more than tiny, usually arm-based, computers. Given that you find a vulnerability, there is no reason you wouldn't be able to do this stuff. Doesn't mean it's easy though. Not even close.

I also was about to say that! I believe there is a way to RAT their phone, look around on the forums, I believe there are a couple posts about it.

Install BackTrack, and learn how to crack WiFi networks. That's the best advise I can give you.
(Install it on your laptop. :))

Ok i will look into this "Backtrack" thing :P thank you

?ain - *June 11, 2014, 1:15 pm*

You can RAT androids. Its called AndroRAT.
There's a FireFox drive by that actually works on mobile devices. You can root your Android and use dSploit to force anyone on an LAN to view that page. You can also use Network Spoofer. You have to have root access, however. Just have your FireFox drive by download AndroRAT, which you could set up on an RDP and access from your phone.

Frivolity - *June 11, 2014, 1:16 pm*

Don't think it would be possible to hack someone on the go through phone, but if you're both on the same wifi you can use dSploit on a rooted Android device to do various MITM attacks.

Other than that I don't know.

Didnt BackTrack get discontinued? I thought they changed their name to like Kali or something?

Use Kali. Its basically Backtrack 6. Backtrack 5 is outdated.
If you just want to crack WiFi, there's brute forcers on Android, I don't think the wireless card in Galaxy's support it however, only HTC Ones(?) But I know they work on Nexus.

Eazzy - *June 11, 2014, 1:23 pm*

Wait can i hack their phones on the same wifi? cause i was planing on hacking someone at school... and they use the school wifi and i have that password

Yes you want what is called pirni pro

To hack users in a wifi network this is a arp spoof attack with sslstrip to capture https data

Also I will link a tool I created to hack remote users via iOS
