Thread: my computer wont turn on

Madara! - *January 23, 2015, 5:21 pm*
when i try and turn on my computer it shows the first few things like dell and f12 shit then it goes blak screen instead of showing windows 7 start up. i dont know why it does this...can anybody please help me!? should i run a diagnostics thing in f12 or no? please help

(sorry if this is the wrong section)

Did you check your Hardware connections? HD, CPU Fan, RAM, PSU, etc?

pooky120 - *January 23, 2015, 5:22 pm*
Mhmm, I'd boot onto a hirens disk (google hirens boot disk), run that and see if your PC is picking up your HDD and run a few tests while you are in hirens.

Hirens is a mini bootable windows and it has many diagnostics tools < best tool ever use it all the time as a Technician.

I have no clue what this means... It just wont turn on... I can run a diagnostics at startup but that's it. Everything else will not show/work..

The internal components of your computer. Make sure everything is connected, try to boot into safe mode with command prompt if you can. Should be F8 I believe.

From what it sounds like something 'may' have been corrupted in the system, If you haven't installed anything in the past 24 Hours I would Restore it back about a day or two whenever the problem did not persist.

My computer was taken away from me by my mom for a month and I just got it back. It was in here trunk of her car and when I got it back it wouldn't turn on so yeH..

That sounds really weird, make sure everything is connected properly with-in the pc.

If it's been bouncing around hard disk maybe a bit fucked like i said run hirens disk and run a health/error test and if your HDD has any bad sectors i'd recommend buying a new hard disk and like Hypnotized said check the connections, they may have came loose while being in the back driving around :L
