Thread: [TUT]How to turn your android device into a usefull hacking program

kmz2200 - *August 23, 2015, 4:09 pm*

Hey guys its me kmz2200/kmz2222 this is my main account and i am no more doing anything on ther other account kmz2222.

So u kno i came back here checked my last TUT to see what people said about it.. some said that the site is harmful.. while it was the offical site of the program... but i saw some people really appreciate it btw the tut was about the armitage tool.. whatever thank you guys and lets get into it:

Before i made a winrar file that i collected every single hacking apk i have and shared it with u guys but some said its harmful shit and stuff so imma explaining what i can do with those apks in several threads in hackforums.

The actual tutorial:

1-First of all u need to root ur phone/android device so for that imma using an easy program 1 click root called KingRoot [Google it for the download] so after you install the app u will click the button and wait untill it gives u a green check mark. Rooting is basically give u full access to the phone but it actually dont fuck it up as some of u guys things.

2-after dat we need to get an app called BusyBoxPro that will make us use almost any hack app. ik ik it costs money but here in hack forums we don't give a fuck so to download the apk u can google it IF u didnt found it u can install an app called Aptiode[Google it] and type in search bar Busy box pro then scroll down click search in other stores.. select any browser [usually google chrome if installed on ur device] then find busy box pro click on it click download/install and voila u have it then u open busy box pro wait it untill it loads click install.. wait couple seconds and done!

3-Now comes the actual hacking stuff whatever ur going to hack it will require almost the same apps..whatever so To hack a Computer/Android device/Almost anything can connect to a wifi.. download a program called Dsploit[Google it] so this program usually used to hack computers by a phone but it could come in handy in other sitiuations so after downloading it u can do many stuff u can also search on youtube for tutorials.

4-With Those 2 Simple apps u actually can get a good internet almost anywhere. i use this alot when i go into different houses and it actually works. so first download and install WPS Connect And Wifi Analyzer [Those two apps are in the playstore.] so first u need to find the nearest wifi spots to you for that u can use wifi analyzer to help u! after u got da spot open wps connect.. give it root access and click on the refresh button and click on the wifi u want to hack. choose a pin or enter a custom pin [optional] and click connect. The more pins u try the better chance to get the password of that wifi NOTE:sometimes the app is buggy and actually if u click settings [the 3 dots icon] and then click show passwords u may find the password of the wifi u want to hack![this actually happened to me several times]

Guys it took me alot of time writing this so please make the thread alive and tell me what u think about it in a reply!
