Thread: How to make PVA Instagram Accounts from your PC [Without Bluestacks]

elwaleed00 - *February 9, 2016, 5:34 pm*

So first things first, there are a few requirements.

- A device with Windows 10 (I know, that sounds really awful, but I upgraded my old Windows 7 laptop and Windows 10 runs just fine if not better on there)

-Dedicated Proxies: Instagram Proxies, specifically. I made the mistake of getting "private" proxies, and my IG accounts ended up banned in no time.

- Disposable Email: Just google it.

Okay, Lets get started.

Assuming you have Windows 10, Go to the store and download the app "InstaPic". It's a great alternative to PC's who can't run Bluestacks or those who can't make any accounts off their smart phones.

cdn.pbrd. co/images/MkRkqsp.png

Once you have the app installed, Go to your proxy website, for example, I use Proxy-N-Vpn, and find your Proxy address.
I don't want to post a picture, but if you're a beginner, your proxy is gonna look something like this: 123.4.567.890
and the port # is gonna be something like:12345

Before we get too deep, make sure the IP Address of your Computer/VPS is added into your proxy whitelist. I'm not going into detail on that, some things are better to learn on your own. ;p

Once you have that, Go to your Windows Start Menu>Settings>Network & Internet> Proxy. Scroll down to "Manual Proxy Setup" and turn on proxy usage.
Go back to the app and register with your DISPOSABLE email, and Wa-la! You have an instagram account.

But now you're probably going to want to Phone Verify, and thats where we turn to google voice. I'm not going into too much detail about google voice or how great it is, but what's awesome is that when you sign up for your free google voice phone number, you can literally use your mobile phone number an unlimited amount of times for an unlimited amount of accounts, being that you remove it from the previous accounts.

Long story short, Sign up for Google Voice, Get the Phone Number, and use that to verify the Instagram account.

If you plan on using bots, be sure to not run them too hard, that way so you don't have to re-verify.

And there you have it, You just created a phone verified Instagram Account, From your PC, That you can Upload pictures from!

Just a few notes before I go:

- 1 Proxy IP = 3-5 Accounts. Don't go crazy.
- I always use CCLeaner to clean everything up after I make 1 account.
- Write down everything, It'll save you struggle in the future.
- Don't want to use your phone number for the google voice account? Look up text-now. You get free call credits and you should be good.?
