Thread: [HELP] Sending mail from domain name

purest21 - *December 11, 2016, 9:52 am*

Hello people i don't know if this is the right forum for this but i need some advice.
I need a free or cheap way to send a mail and make it look official by making the sender address a domain name; for example "customer@chemindustries.com"
I've tried some email spoofers/fake mailers but they can neither attach files nor receive response if the mail is replied.
Can anybody suggest a free or cheap way to do this to enable attachments be sent and response received

Are you trying to send emails from a domain you own, or are you trying to fake it?

If the former, you'll probably need to look into setting up your domain with something like Google Apps for Business to get email@domainname.com

If you're trying to fake it, you'll probably want to go into the Beginner Hacking forum.

If you're trying to send transactional (legit) email, I would reccomend something like SendGrid - if you have access to a .edu email they offer 14k free emails per month and I believe a dedicated IP but don't quote me on it. They also offer PHP/Node/Perl integration which is simple enough.

I wouldn't reccomend trying to send emails from your server, you will either get the servers IP blacklisted for SPAM, or all of your emails will just end up in the spam folder and won't be read.
