Thread: $200 3D printer.

SIM-2362662 - *April 25, 2017, 4:30 am*

Buy Here

The Tevo Tarantula is a really cheap 3D printer. For only $200 you are getting the printer + 2x 250g filament rolls + 8gb sd card (a really shitty card, but still).

I bought this printer almost three weeks ago. It arrived a week ago. I managed to assamble it in 3-4 days (assembly videos can be found on youtube and is really fun). The printing quality is really good for a $200 printer.
Also, there is a huge facebook group dedicated to this printer ready to help with any possible problem.

Some of my prints :

Just out of curiosity, how expensive is it to run one of those things? How much would filament cost...?

1kg of filament costs about ~$30
With that much filament you can print a lot of things.
As refference, all the pieces that i have in my hand in the secound image only weight 30g. (30 pieces, ~1g each)
