PHP API issue only using one API rather than all that is stored in DB

i spent hours working on this to release to public but this one issue has me confused it will only send to 1 API

PHP Code

```
<?php
                                        $insertLogSQL = $odb -> prepare(
"INSERT INTO `logs` VALUES (NULL, :user, :ip, :port, :time, :method, UNIX_TIMESTAMP(), '0')");
                                $insertLogSQL -> execute(array(':user' => $_SESSION['username'], ':ip'
=> $host, ':port' => $port, ':time' => $time, ':method' => $method));
                                $SQLSelectAPI = $odb -> query(
"SELECT `api` FROM `api` ORDER BY RAND () LIMIT 1");
                                $SQLSelectAPI2 = $odb -> query(
"SELECT `api` FROM `api` ORDER BY RAND () LIMIT 2");
                                while ($show = $SQLSelectAPI -> fetch(PDO::FETCH_ASSOC))
                                {
                                    $arrayFind = array('[host]', '[port]', '[time]', '[method]');
                                    $arrayReplace = array($host, $port, $time, $method);
                                    $APILink = $show['api'];
                                    $APILink = str_replace($arrayFind, $arrayReplace, $APILink);
                                    $ch = curl_init();
                                    curl_setopt($ch, CURLOPT_URL, $APILink);
                                    curl_setopt($ch, CURLOPT_HEADER, 0);
                                    curl_setopt($ch, CURLOPT_NOSIGNAL, 1);
                                    curl_setopt($ch, CURLOPT_RETURNTRANSFER, 1);
                                    curl_setopt($ch, CURLOPT_TIMEOUT, 3);
                                    curl_exec($ch);
                                    curl_close($ch);
                                }
```

It looks like you aren't calling $SQLSelectAPI2

I don't want to steer you in the wrong direction as i'm still learning too, but from what I can tell the while loop is only being performed on $SQLSelectAPI , not $SQLSelectAPI2.

In other words you are only showing the results of the first query, not the second.
