Thread: Building a interface app to bypass browser heavy forums!

flexing_99 - *March 10, 2020, 9:28 am*

I come up with a idea to overcome a problem i got while posting on forums online. Some forums had a lot of useless code that only hang up the browser, i then design my own interface (app) that let me choose a forum and sub-forum and write my title and message. With a distance of click i can post in those forums (even if they hang up, the post request was already made).

Does anyone has any questions or are interested in this app?

Thanks

Does it use Ajax XHR? Or did you find another way to bypass Access-control-allow headers?

Not using XHR Ajax, the library is too large.

Here is a print

Awesome. If it works, I guess.

Might not work on some specific forums that have CORS protections though, but I'm sure it will work on most.

I do not intend to give away but at least some of the forums work. It's a timer saver on some forums that load up very slow because before it serves any code like images, banners it already finished the submition.

I'm thinking in additionally to the forums that i have, include Non-English too (Just translated in the app).
