Thread: [Botnet, Stealer, Keylogger]:  Innovative browser extension with control panel

**Jenkinssss** - *October 5, 2023, 12:29 am*

I present to your attention an innovative browser extension with an accompanying control panel.

The ready-to-use software is developed using modern frameworks and advanced technologies, which ensures easy scaling and further expansion of functionality according to your needs.

After successfully integrating the extension to users, you will be able to use the control panel for the following actions with their browser:Download their cookies.

Open any websites to them in visible and invisible modes.

View the text they enter on all websites.

Embed any JS/CSS code into web pages, thereby accessing their data and doing actions on any website on their behalf.

Show them push notifications with clickable URL or CSS popup.

Take screenshots of the currently open tab.

Enable/disable any of their extensions.

View their computer information.

View their web browsing history.

Enable reverse proxy-server to use their IP address and cookies in real-time.

Replace their copied text with the one you specify in the regexp control panel, e.g. replace the copied crypto address.

You can also integrate the app into your Telegram.

https://ibb.co/NThz052
https://ibb.co/K7Bwby2
https://ibb.co/jDwCnyK

Upon purchase, you will receive:Source code control panel installed on your server.

Browser extension along with its source code.

One-time support with setup and check how it works.

Total Cost: $3,330
Telegram: i8414

There are also ready-made injects for crypto exchanges on sale.
They work as follows:Injects are inserted into the control panel and when a user with the extension goes to the specified site, this JS code (inject) gets to his page. The user then sees an unclosed "Security Check" pop-up window with the need to enter codes from SMS, google auth, and email. At the same time, all his assets are instantly converted to BTC, and when he enters the confirmation codes, the BTC is sent to the address you provided in your control panel.
These scripts involve replacing the emails that arrive in the mail: instead of the caption "Withdrawal Requested", the user sees "Authorization Requested".

The list of available injects:
Binance, Blockchain, Bybit, Huobi, Kraken, OKX, Bitget, Kukoin, Coinbase and Bittrex.
[contract=tid]Start Contract[/contract]
