Thread: How Vulnerable Are iPhones to Malware and Surveillance Software?

Parakurwa - *February 11, 2025, 10:42 am*
I've heard that iPhones are practically immune to viruses—is that really true? Are there ways to install parental control programs or other tools to collect information from an iPhone?

Someone told me they have access to a one-time-use program that costs $2,200 per attack and only requires an IP address to work. Is this realistic, or does it sound like a scam? There seem to be many differing opinions on this topic and a general lack of real knowledge among those discussing it. What do the experts say?

Yes, iPhones are generally more secure against viruses compared to other devices. As for parental control programs, there are options available in the App Store. As for the program you mentioned, it sounds like a scam. It's always best to be cautious with such claims and do your research before considering something like that.

$2,200 per attack and only requires an IP? If it sounds too good to be true...

Jamika - *February 11, 2025, 12:08 pm*
Very safe , if u have enough money to buy one you r good and safe more than if u have android

found this tool on this website , called O-M-H cable a cable that will keylog the persons phone when charging , even possible execute commands. Maybe there is a way in the phone if you really want.

The alleged cost is way too low to be real, but there are absolutely zero-click exploits for iOS sold on a regular basis. You're looking at $250k-$10M range though. Not pocket change.

iOS is perhaps the most researched and exploited OS of modern times. Do not even think for a second that it's secure from targeted attacks. It IS secure against your average joe.

Exploit broker is the term you're looking for. You can search for them. They come in all shapes and sizes from very shady to highly legitimate with strong verification requirements.

Foxxy Proxies Ltd - *February 11, 2025, 7:47 pm*
The Israeli's have had success with Pegasus and some other shit for ios. But that's government level stuff.

Send me a pm and we can start a contract on HF. I offer a remote administrative tool for iOS devices. It’s easy to install as it’s a 2-step method. Starting at $24.99 (prices due to change at any given moment). Let me know if you’re interested.. no jailbreak, passcode, or apple credentials required.

It depends.... iPhone can get hacked just like any other platform. However, it's not as easy as compared to a windows OS.

There's software like that ....where you pay someone and they give you software that all you need is an ip address and it will infect that machine.
That is normally software that exploits the OS or the network driver/ firmware that allows such attack. However, is this a common thing or is it happening often the answer is no. Such things ends up getting patched and it may at a later time not work anymore if that device gets an update.

Also IPHONES and macs get viruses just like windows but it's not something that happens as often as windows but has been increasing over time.

So, that answer is yes to your questions but it's rare and it's not something often.

Yes, like MacOS, iOS is quite strengthened and close, you are not as free as on Android.

That tool does exist and it does work not just on iphones but androids too and other phones etc.
