Thread: [\[TuT + Pics\] How To Transfer Photos From Your iDevice Through WiFi For FREE!](#)

Inventor - April 30, 2011, 10:17 pm

Hello guys,

Ever wanted to transfer your photos from your iDevice to your computer, but too troublesome to plug in your iDevice to your computer and sync, then open Image Capture/iPhotos and such? Here's a solution for you to transfer photos wirelessly to your computer. This tutorial doesn't require a jailbroken iOS.

Download [WiFi Photo Transfer](#) app to your iDevice, or search it on AppStore.

Spoiler [\(Click to View\)](#)

Open it once you have installed and you will see the following screen:

Spoiler [\(Click to View\)](#)

Go to the URL specified on the screen, along with the port, then you will see the photo albums on your Photos app showing up on your browser.

Spoiler [\(Click to View\)](#)

Click on any albums, e.g. Camera Roll, and you can see all the photos inside. Click on any photo you want to transfer and you can see the download options on top. There is 4 options for you to choose from, which is full size, large, medium and small.

Spoiler [\(Click to View\)](#)

Click any of them and it will perform a download to your computer.

P/s: There is another app called [PhotoSync](#) which has much more features than this, but there is a \$1.99 price tag for that. With that you can transfer from your computer to your iDevice as well. You might want to try that too!

This tutorial is 100% made by me, and any attempts of copying this to another source require permission and credits.

Thanks for reading and I hope you like it.
