Thread: [Load string from string.domain.com ?](#)

The Chronic™ - May 2, 2011, 11:14 am

Hey, i want to make like homo.com
where it loads the string entered in STRING.domain.com
How can i do that?

iBones - May 2, 2011, 11:40 am

Should do it:

PHP Code

```
<?php
function get_sub_from_url($url) {
    $data = parse_url($url);
    $sub = explode('.', $data['host']);
    return $sub;
}
```

Gene - May 2, 2011, 4:06 pm

PHP Code

```
<?php
$url = "string.domain.com";
$string = explode('.', $url);
$string = $string[0];
echo $string;
That should work too.
```

Nathandj - May 2, 2011, 4:13 pm

Use explode();
Like, as right above me.

w4d - May 2, 2011, 9:47 pm

As for getting multiple sub directories (ex: <http://example.name.homo.com>), here's the way I would approach it:

PHP Code

```
<?php
$host = $_SERVER['HTTP_HOST'];

$hostarr = explode ('.', $host);

for ($i = 0; $i < (count($hostarr) - 2); $i++)
    echo $hostarr[$i] . " ";
?>
```

That should do it - the -2 should remove the "domain.com" at the end and just get the subdomain(s). :)

blackstrider - May 3, 2011, 12:55 am

It can also be a url rewrite feature of Apache which comes from the mod_rewrite module. It's behavior can be edited using directives written inside .htaccess file.

The Chronic™ - May 3, 2011, 3:36 am

Yearh thanks for the codes..

But i mean if you go to example.domain.com

How do i then make it redirect to for example domain.com?lol=example

Nathandj - May 3, 2011, 4:06 am

Use get on the local domain, to redirect -> subdomain.

PHP Code

```
<?php
ob_start();

if (isset($_GET['redirect']))
{
    header('Location: http://'.htmlspecialchars($_GET['redirect']).'yoursite.com/');
}

ob_flush();
?>
redirect.php?redirect=Nathan
```

Should link to: <http://Nathan.yoursite.com/>
