Thread: [\[Mega Thread\], iTunes, Installous etc "Error Collections" with ?Solutions?](#)

devi01 - May 15, 2011, 6:41 am

Hello Hf today I collected the problems and errors around for iTunes, Installous and other about iDevices.

IF you will have other problems can post here and WE will provide the right solution.

Hope it will help you to fix the problems.

Well let's start...

iTunes Errors:

Errors -9815, -9814 , -9800

Set exact date, restart computer.

Error -50

Delete Storm Vedio, QuickTime, iTunes, then reinstall iTunes

Error 1

Unable to downgrade. Try changing the USB port (the back one of chassis is better) and restart computer.

The installed version of iTunes may also be too old. Update iTunes.

Error 2

Sn0wbreeze 1.XX Custom Firmware has a ASR patch problem. Use sn0wbreeze 1.7 or latest or PwnageTool. Device isn't bootable.

Error 6

Not enter the downgrading mode, change USB port (the back one of chassis is better) and restart computer.

Error 10

LLB is missing from the IPSW. The device cannot be booted up. The trick to skip the baseband update no longer works.

Error 11

Removed bbfw file in the firmware folder of an unzipped IPSW.

Error 13

Occurs when you want to install a beta firmware with iTunes for Windows (actively blocked by Apple; beta users are developers and therefore must have a Mac).

Error 13 may also signify a USB problem. Check the USB connection and try other direct ports or maybe the USB cable is an older one. Device isn't bootable.

Error 14

Custom firmware update fail (PwnageTool). You have to restore the device with a custom firmware. Update to a custom firmware isn't working. Device isn't bootable. 2

USB Problem. Check the USB connection and try other direct ports or maybe the USB cable is an older one. Device isn't bootable

Error 17

Custom firmware update fail (sn0wbreeze). You have to restore the device with a custom firmware. Update to a custom firmware isn't working.

Error 26

False version of the NOR flash firmware. Use the correct sn0wbreeze version.

Error 37

iPod touch 2G LLB patched with the 0x24000 Segment Overflow was used on an iPhone 3GS custom firmware. Known on damaged bundles from unofficial PwnageTool distributions or bundles.

Error 1002

Are you restoring to a stock apple firmware or a custom pwn firmware? Either way make sure you are in DFU mode first.

Error 1004

This is caused by a failure to match the Baseband Nonce currently in memory to the Nonce returned in the BasebandFirmware SHSH blob. This is a normal part of iPhone 4 local restores via TinyUmbrella.

Error 1013

Restart computer; change computer; reinstall system, if iPhone is always in restoring mode: XP users can jump from restoring mode with ibus; MAC users can use iNdependence.

Error 1014

This error is down to itunes not liking your USB ports on your computer. Use a different USB slot or a different computer if possible. That is the easiest fix!

Error 1015

Restart computer; change computer; reinstall system, if iPhone is always in restoring mode: XP users can jump from restoring mode with ibus; MAC users can use iNdependence. Baseband firmware on the IPSW is higher than the baseband firmware on the iPad/iPhone.

Error 1413, 1415, 1417, 1418, 1428, 1602

Restart computer; change USB port; reinstall system.

Error 1600

Custom firmware can't be restored on a device with DFU Mode. Use Recovery Mode.

Error 1603

False kernelcache patch. Known on damaged bundles from unofficial PwnageTool distributions or bundles.

Error 1604

Device was not pwned (signature checks were not blocked). Custom firmware can't be restored.

Error 1611

iTunes tried to enter the Restore Mode, but the device turned back to the Recovery Mode.

Error 1619

iTunes is too old and couldn't read the iPhone in Recovery or DFU Mode. Please update iTunes and try it again.

Error 1644

IPSW was moved during prepare with iTunes. Try it again and don't move the IPSW.

Error 2002

iTunes can't connect because another program is using it or it's disconnected during the Apple Server check.

Error 3XXX

iTunes can't connect to gs.apple.com. Maybe Port 80 and Port 443 is blocked. Open it on your router.

Error 3002

Update to an older firmware isn't working, because Apple is no longer handing out SHSHs for the device/firmware combination.

Error 3004

No internet connection during the firmware restore.

Error 3014

False edited hosts. The SHSH request couldn't be completed. No connection to the Apple Server, Sauriks Server or localhost.

Error 3194

Occurs when trying to install an old firmware and Apple's server disallows the installation. The only solution is to have SHSH backup and modify the hosts file to point to Saurik's Cydia server where they are backed up (or localhost if you have it yourself)

Error 3195

"An internal error occurred." Missing SHSH for the firmware. Maybe the same as "This device isn't eligible for the request build." but with an cache error.

Error 11222

internet options Connections tab Click LAN Settings uncheck "use a proxy server"

0xE800003D

False permissions in the Carrier Bundle folder. Restore, update or fix the permissions from the carrier bundle to update the carrier settings via iTunes.

0xE800006B

Device was suddenly unplugged. iTunes couldn't connect with the device. Try it again.

0xE8000065

sn0wbreeze custom cirmware error on USB connection. Unplug the device, reboot it, and plug it in again.

Installous Errors

I'm trying to update Installous, but it doesn't show the latest version, just an old one (3.x.x)

1. Remove the following repo and re-add it: <http://cydia.hackulo.us>
2. Go to the Manage tab in Cydia, then Packages, and uninstall Installous. Then Refresh the Changes tab, and re-install Installous, with all the new, updated dependencies.

When I try to start downloading Installous, a dependency problem comes out.

You need to be on a firmware greater than 3.1.x, as Installous doesn't work any firmwares lower than that. Upgrade to 3.1.3, or iOS 4.0.1

During the download process, Cydia displays a "POSIX error"/"size mismatch" error

1. The download has timed out. Cancel it and try again.
2. Download the deb file [here](#)
3. Copy it into /var/mobile (use iFunbox or SSH) and use iFile (click on the deb and press Install) or MobileTerminal to install it (Command = dpkg -i installous-4.2-1.deb)
4. Remove then re-add the following source in Cydia, and download Installous from there: <http://cydia.hackulo.us>

Apps that I install don't show up on the SpringBoard (Can't be found)

1. Make sure you have the correct version of AppSync installed
2. Uninstall AppSync and Installous. Reboot. Install AppSync. Reboot. Install Installous.
3. Search for the app you installed in Spotlight (Swipe right from first SpringBoard page)
4. If you have qTweeter installed, use SBSettings to disable the qStatusHelper plugin (More – MobileSubstrate Addons – OFF)
5. Go into Safe Mode using SBSettings (which disables mobile substrate) and try to install the app(s) again. There may be a conflict with a MobileSubstrate Addon.

When I try to use an app, it crashes and goes back to SpringBoard

1. Some of the apps have been on ARM7 devices (3rd generation devices). 1st and 2nd generation devices have an ARM6 processor, which can't execute apps cracked on the ARM7 processor, which is why they crash. Try downloading the app from another link (cracker)
2. The app may be self-aware, so it realizes it has been cracked, and terminates itself after a few seconds. This means it's a bad crack.
3. Your device's firmware may be incompatible with the OS requirements of the app. Check the AppStore for compatibility, and update (If you wish to)

When I try to sync my apps to iTunes, they either don't transfer, or get deleted.

Solution 1

1. Make sure you have the correct AppSync version installed for you firmware
2. Make sure you have at least 1 legit app from the AppStore installed, free or paid.
3. Make sure your device IS NOT connected to the computer while you install an app.
4. Try rebooting, or Respring, after you install an app, then try syncing again.
5. Make sure iTunes Sync is ON in Installous.

Solution 2

1. Right-click on your device icon in the left menu in iTunes (under Devices), and click Reset Warnings
2. Right-click again and click Transfer Purchases

Solution 3

1. Download an iDevice filesystem browsing program, like iFunBox, or iPhone Explorer (make sure you have afc2add from Cydia installed)
2. Open the program you chose, and navigate to var/mobile/Documents/Installous/downloads
3. Copy the ipa files you downloaded to a folder somewhere on your computer (where you can find them)
4. Open iTunes, click on File (in top left) and click on Add File to Library, then navigate to the folder where you copied the ipas, hold down Shift (PC) or Command Key (Macs), select all the files (click on the 1st, and the last) and click Open
5. Alternately, you can select multiple files using CTRL, right-click and click Open

The AppStore is showing updates for applications I installed using Installous

Some of the cracked applications contain a file called iTunesmetadata. The AppStore scans for this file and if it finds that an app has it, it will search for updates for that app. There is NO need to delete the file, unless the update badge is really annoying. Installous has an integrated metadata remover. Go to Settings, then switch On Remove Metadata

I updated my app in Installous, but it still shows an update notification in Updates

The ipa you downloaded wasn't the latest version. Either the cracker submitted the wrong version of the app (didn't bother updating it), or the developer forgot to change the version numbers.

1. Try downloading from another link. When the download begins, look at the name of the file; if it's not the latest version, cancel it and try again
2. Wait until a proper updated version of the app comes out
3. Some apps (like the Google app) have incorrect/messed up version numbers. Ignore the notification, or swipe left on it in the Updates tab, then press delete.

I get an "Error building SBCache: No DSID found" notification when trying to install an app
Install at least 1 legit app from the AppStore, either free or paid.

I get a "Permission Denied" error when trying to download apps

AppTrackr has banned your IP because you have tried to get the download links too often.

1. Wait 24 hours to get a new IP (Almost everyone has a dynamic IP, which changes on a daily basis).
2. Find out your IP using this [site](#), When you have your IP, send a message to [supaanz](#),
Note: Just sent your IP address (something like 62.75.123.45) , nothing else.

I get an "Unexpected Content" when I try to download an app

This error occasionally occurs when you try to download an app from FileDude, and is not related to Installous. Due to millions of people trying to download files from FileDude, their servers sometimes get overwhelmed, and when Installous requests an IPA file, FileDude instead displays a HTML page with "ticket expired" error, which is a format that Installous doesn't recognize

* Try downloading the app from an alternative link, like MediaFire, or if there are none, retry FileDude from a different uploader.

I get an "Invalid IPA" error when trying to install apps

When you get this error message, the iPhone built-in installation framework failed to install the IPA.

1. Make sure you have AppSync installed (the correct version)
2. The IPA you are trying to install is either incomplete (not the full file), or it's not .ipa format (a .rar archive etc.)

I get an "API Unavailable" error when trying to download an app, scan for updates or re-cache categories

Installous is unable to communicate with Apptrackr. This is usually due to AppTrackr undergoing maintenance.

1. Make sure you're connected to a working WiFi network
2. Wait a few hours for AppTrackr to come back online

goligautham - May 16, 2011, 9:15 am

Well, If this isnt a Copy Paste work, Then you've really done a greate Job.
If ever I get any error , I ll come to this thread.

Thanks. :)

devi01 - May 16, 2011, 10:09 am

Well, If you have read well in the beginning of this thread I wrote:

" I collected the problems and errors around for iTunes, Installous and other about iDevices."

But anyways you are welcome.

Thanks...

Hate Sleeping Alone - June 16, 2011, 1:59 am

hey bro do you know how to fix invalid ipa on installous ?
its pissing me off

its pissing me off

Just install AppSync from Cydia my friend, thats all.

Thanks...

Falconw0w - June 16, 2011, 3:55 am

dude like always 1st class thread ! Good job!

D3xus - June 16, 2011, 4:13 am

Seems legit. Nice work! :D

[/congrats]
