Thread: [\[VB.NET\]Window Hack Class\[SOURCE\]](#)

BlackCap - May 18, 2011, 8:15 am

Hi HF, i have lately been working at this Window Hack Class, and pretty mutch skipped studing for my english examn to work with it, so thats why my posts are full of spelling/grammar misstakes ?

Weary technologic sayed, this is a class used to manage windows and controls that is not owned by your application.

That means that with this class you will easely be able to remove that fucking banner inside of spotify, hide and disable the start button orb and menu or just change the tittle of an window ?

I know i have been posting this class b4, but in this version i have managed to track all the controls from a spesific window, sorry if you'r tired of this post.. ?

The project comes with an test form to help you understanding the class, lets just start of with pics of it, shall we?:

Set the text property to change the tittle of an window

[img]http://filesmelt.com/dl/Capture137.PNG[/img]

Cange the parent property to place a window inside your own..

[img]http://filesmelt.com/dl/Capture225.PNG[/img]

..or another (Yow dog)

[img]http://filesmelt.com/dl/Capture314.PNG[/img]

Change the caption property, then invalidate the control (This may not work on all controls)

[img]http://filesmelt.com/dl/Capture411.PNG[/img]

Removed the start orb as i told above (h)

Usage:

In order to use the class in your own projects you have to add the Window and WindowControl classes found in the security folder inside the zip (download link at bottom of the post).

When declaring the window class you have to describe what window you'd like to use. You can do this in 4 ways:

You can give the tittle of the window in string

Code Dim NotepadWindow As New Window("Untitled - Notepad")

You can give the window handle in intptr

Code Dim MyWindow As New Window(NotepadHandle)

You can use an System.Diagnostics.Process

Code Dim NotepadWindow As New Window(NotepadProcess)

You can just leve it blank, and it will use the window currenty used by the user.

Code Dim NotepadWindow As New Window()

Just like the Window class, the WindowControl class needs the handle of the control to use.

You can only declare the WindowControl class in one way, with an control handle in intptr (You can get these using the GetControls function in the Window class):

```
Code Dim MyButton As New WindowControl(ButtonHandle)
```

That's about it. Please give creds if you use this class, and would be greate if you told me what functions to add next. ?

My 'useful sources folder' just got bigger. Nice work, I will certainly give credit if I use this someday.

nice nice nice nice work dude!

?Demon - May 18, 2011, 9:29 am

It looks really cool, thank you. ^.^

FreshHRS - May 18, 2011, 10:57 am

That looks useful! Nice and thanks!

alexbazzatu - May 19, 2011, 12:45 pm

Nice work dude very cool project

?Demon - July 3, 2011, 8:58 am

Sorry for the old , I didn't need it before but now I need it, take a look this is VERY useful.
