Thread: [i have IP address of a person , how can i access pc of that person???](#)

shaktisinh_1991 - May 21, 2011, 5:38 am

Need help plz

i have IP address of a person , how can i access pc of that person???

is there any tools or trick so that we can access that person's PC from IP address????????????/

longrifle0x - May 21, 2011, 5:40 am

shaktisinh_1991

open 445 port and Use Metasploit!

Basics. - May 21, 2011, 5:41 am

You can only access someone's PC via RATing & Keylogging (Keylogging will only send keystrokes, though). Best you can do with an IP is DDoS the fuck out of it.

IIIIIIII64IIIIIIII - May 21, 2011, 5:42 am

You want to get inside of this persons pc? lol Get a RAT dude. And don't ask in this thread where you can get one xD Atleast 50 people a day post RAT related things...so in other words the search button would be your best bet on here. Mostly people on here can only knock the persons pc offline knowing his IP address using Ddos methods or other methods.

Phizo - May 21, 2011, 5:43 am

You can try and run exploits on it. I doubt you will have any success due to updates.

idin54 - May 21, 2011, 6:10 am

Wait for 10000year to acces via ip -.-"

The Decoder - May 21, 2011, 6:17 am

First - IP wil be change evry time u connect
and Use Metasploit 4 hack His open ports

Zita - May 21, 2011, 8:19 am

how ddos work on someones PC ??

IIIIIIII64IIIIIIII - May 21, 2011, 8:38 am

(May 21, 2011 08:19 AM)Zita Wrote: [\[CITE\]](#) how ddos work on someones PC ??It doesn't really do a lot to be honest nothing too cool just knocks them offline for a bit the cool things that most HF users are using nowadays are RAT's do a search on it on here and it should come up with like 3000 results <<hyperbole for those of you who will give me an exact answer to the number xD

Sonic Boom - May 21, 2011, 9:18 am

If he runs an old version of Windows XP the chances of hacking him with Metasploit are not slim.

Here's the problem with having someones IP address, 9 out of 10 times it's an IP address associated with their router, which blocks the majority of incoming connections to their PC (which sits behind the router/firewall and usually has a private IP address i.e. 192.168.x.x). You have a couple options:

A.) You could try to connect to their routers configuration page (usually port 8080 and has default passwords) and try to enable port forwarding to allow you to connect directly to their PC. There's a slight possibility that you can exploit their system remotely (even if you manage to exploit something good luck bypassing DEP and ASLR....unless you can write ROP shell-code). This is highly unlikely, even for professional pen-testers.

B.) Or you can go with the path of least resistance; you want to target something that's accessible to the internet and not patched frequently. Third party plug-ins to browsers are the best (i.e. adobe reader, flash, quick-time, etc.). They make tools specifically for script kiddies that allow you to point and click and create a working exploit. You can simply download such tools as: blackhole toolkit, backtrack, metasploit, etc. Generate an exploit using one of these tools, and simply have your target view a malicious webpage or attachment. Generally speaking you can opt for a reverse connect back shell-code that circumvents the firewall.

If you're interested in actually learning how any of this works then feel free to PM me. I can give you several references to research. Hope this helps...

Try getting Metasploit

Hope i helped

Golliath808 - May 21, 2011, 3:30 pm

Exploit all ports with metasploit but are 10% chances to find something, nowadays those exploits are fixed.
