I happen to visit this..

<http://svn.cac.washington.edu>

Wait..it cant be accessed that way..

But i tried a lil bit and found that it has directory listing vulnerability ?

see <http://svn.cac.washington.edu/viewvc/pubcookie/tags/>

but the interesting part is that,i did a whois look up and got this

Domain record activated: 04-Sep-1986 <---- 86..? isnt that cool..? ?

Its an old man there..

Dont know if this make any sense,i was just sharing.?

stitch3s - May 25, 2011, 6:28 pm

Yerp, a lot of the big organisations have domains / records from years and years ago. :)

n3xus - May 25, 2011, 6:38 pm

Lmfao that isn't a "directory listing vulnerability", that's a fucking subversion repo, its supposed to be like that.

stitch3s - May 25, 2011, 6:39 pm

Oh and yes, n3xus is correct. SVN = SubVersion.

http://en.wikipedia.org/wiki/Apache_Subversion

F4T4L 3RR0R - May 25, 2011, 9:34 pm

I LOLed so hard at this.

Not only was it obvious with this: "copying repository to tag final 3.3.5 release"

But also pretty sure a real directory listing vuln doesn't have any sort of textbox or logo. Could be wrong though.
