Thread: [Hack Folder Lock](#)

MScorporation95 - May 30, 2011, 7:36 am

hey guys... I've found a trick to hack folder lock to get the locked as well as hidden data. This works even if the user has disabled the option of master key.

Follow these steps:-

1> Go to registry (open run and then type regedit).

2> Keep in mind that the highlighter is on "computer". Press Ctrl+F. The find dialogue box will appear.

3> In that box, in "find what", type folder lock.

4> Only check the "Keys" checkbox in look at and check the box labeled "Match whole string only" and then press find next.

5> Delete the string value named "Item" and "MIME".

6> Close the registry and then open folder lock.

7> It will ask for registration, use this:-

User ID: Deep Blue

Registration Key: 774722522

8> After registering, when it will ask you to enter the password to get access.

9> At this point, just type the registration key as password ie. 774722522 and ur done! ?

Explanation:-

Actually, when we delete the string values Item and MIME, It Removes the user id as well as sets all the setting to default, IT MEANS THAT the master key (using registration key as master password) option gets enabled and then we can get access by using master key.. After getting access, you can change the password. ?

Hi,

did you ever find a way to hack Folder Lock 6.5.

I also have some important files I need to recover from my locker.

Trish
