Basics. - June 20, 2011, 10:16 am

[img]<http://img69.imageshack.us/img69/4262/introy.png>[/img]

You must be new to this section. If you are, welcome to the world of hacking. In the "Hacking" category you'll find a lot of tutorials that will interest you. A lot will be hard to understand, but if you want to be a successful hacker you'll need to keep on learning. Trying to learn too many things at once will clog up your brain, so it is important that you take breaks now and then, but always think back on what you have learnt.

There are plenty of ways to hack your friends facebook or email address. What you should know though, is there is no such thing as a program that hacks a password via the email. If you've downloaded one of these, you should know that you are probably infected. In this small guide, you'll learn the most featured and covered hacking methods on HF. The most covered hacking methods are Keylogging, Ratting and SE (Manipulation). Each one has its own difficulty level, and if you are not focused enough you'll never perfect/master it.

Remote Administration Tool

Also known as a RAT, allows you to basically control what your victim sees. Everything that is done by them, you'll see. You can also view their webcam and mess around with their PC a little bit, which will piss them off. This is also used to retrieve passwords from various sites. There are many different RAT's you can use. Each one has its own reputation, and many agree about which one is better. The couple well known RAT's are :

DarkComet -Free

CyberGate -Free

BlackShades -Paid

PRORat -Free

When encountering a RAT Program for the first time, you won't really know where to start. That's why members have posted some useful tutorials on how to set them up. If you're quite experienced with Rats, then you'll know how to setup PRORat.

Keylogging

Keyloggers are pretty simple. What they do is capture each keystroke your victim makes over a certain amount of time. This can be very useful if you want to get your friends password, or just see what they are typing in General. There are a bunch of keyloggers out there, some you have to pay for, some you don't, and some are Noob protected, meaning you have to crack the password.

Special "WTF Now?" Notice Spoiler ([Click to View](#))

Note: With each RAT and Keylogging program you have, you'll need to do the following:

1) Build The Server with your settings - This "Server" is what you are going to send to your victim to receive his connection.

2) Crypt the Server - When you build a server, it will get detected by an AV Automatically. To stop this, we want to crypt the server so it is undetected by the Avs. Also note: A FUD Crypter will make your server FUD. A UD Crypter will make your server UD, meaning some AV'S will still detect it. [The Cryptography Section](#)

3) Bind Your Server - Bind your server with a program which people would want to download. A lot of people these days still look for tools and gadgets, so bind it with one, and rename it.

SQL Injection

SQL Injection is quite advanced. You have to know you're doing here. Okay, so you have 2 ways of injecting a website - Automatically (Done by a program like Havij) and Manual (Done by yourself). It is best you inject websites manually first, because if you inject a website with a tool and do not know anything, you won't learn anything.

Basically what you are doing is finding out if a website is vulnerable or not. If a website is vulnerable, you can extract important data from it, like CC info, passwords, and more. Once you've got into the control panel, you can delete everything and upload your defacement page, or you can inform the administrator of the website and who knows, he might reward you with some \$\$\$.

What I suggest you do with this is hide behind either a Proxy or a VPN. This is because administrators can see which IP's have visited the site, and if he see's your original one, you might end up in jail. What a VPN/Proxy does is give you a whole new IP until you disconnect from it. This can save your ass from being raided by the cops.

Happy Hacking ?

dashahman - June 20, 2011, 10:21 am

Good job, must have taken a while, this will go nice with T@KU's thread and mine.

BaussHacker - June 20, 2011, 10:21 am

It looks good. Good job bro! :)
