Thread: [\[TUT\] How to change IP to Static or Dynamic \[NEW\]](#)

Shot Caller - June 26, 2011, 6:15 am

Belkin Router tutorial, I have a Belkin therefore I can tell you what to do if you have one.

- 1) Go to <http://192.168.2.1>
- 2) On the heading "Internet Wan" click on the first option under it, "Connection Type"
- 3) Choose Static or Dynamic and click save

Simple.

Thanks4Everything - June 26, 2011, 6:16 am

Sorry but I think you've failed. A static/dynamic IP doesn't have anything to do with your router, but with your provider.

I can hardly believe that, but it is possible, sorry if I'm wrong.

(I also have the static/dynamic settings on my router, it just doesn't do anything when I change it.)

However, I still don't think this belongs in the Hacking Tutorials section. Almost everyone uses a VPN here.
