Thread: [\[FUD\]\[Constantly Updated\]Genesis Logger\[FUD\]\[Constantly Updated\]](#)

This is one of the best current public keyloggers you will find out there, because not only is it currently FUD, it's also going to be CONSTANTLY updated. The second I'm notified that it's been detected in the slightest way, I will get to fixing it.

Yes people, the link is ShareCa\$h. I didn't work my ass off for no reason. I'm not going to ask you to go and buy this keylogger from me for 30~40\$, but I invested A LOT of time into this, as I coded it FROM SCRATCH, like many other people. All I ask is that you use that link to download, please and thank you.

Also note, the stealers in this keylogger aren't the usual "Windows Key" stealers, etc. These are actual saved password stealers, that steal saved passwords from IE7+, Mozilla Firefox, Opera, and Chrome.

I would like to check it out, but I need more responses to know that this actually works and does not carry a RAT with it or something like that.

Explain this to me, why is Avast blocking something in this specific post?

Just when I open it up, I throws a warning. Why?

Why this specific thread and none other on the HF?

I am at loss.

Enlighten me please.

you say it's FUD, but it says that it's detected on the thread! Plus with your rep and post count, I don't think anyone else will trust you, especially since you put a sharecash link. Sorry bud.
