How To Setup Istealer 6.3, And Make Your PHP Script FUD -You Wont Get Banned Again From Your WebHost [VIDEO]-TUT [TEXT]-TuT

My Video TuT

[Video: <http://www.youtube.com/watch?v=gUJ0wQwZjT8>]

[b]STEP 1:

First We Need To Join Cwahi. And register there with an account.

STEP 2:

When you finish with registration, go to Database.

Then, you will need to create a new Database by clicking Create database.

save all of this in notepad we are going to need this

STEP 3:

Now we need to download iStealer and setup the PHP.

I'm not trusted here so im giving this links i found here

[Istealer 6.3](#)

[Istealer 6.0](#)

Run this stealers in sundboxie

STEP 4:

Now we will need to setup the PHP file. Open up the index file found in PHP LOGGER

Now, I will use my username, password & database to show you how to correctly setup that.

And save it.

STEP 4:

Now we need to protect our shit so that we wont get banned from our webhost

Things we are going to need:

[TrueBug](#)

5 more minutes

STEP 6:

install all of that shit and than open it and follow this pictures:

Hello members,

pls i need somewhere to download the obfuscator 1.1 and encoder used on this thread, all the links seems to be broken.

can someone send me the download link or the software?

thanks
