Yeah... open Osama bin Logger v1.0.exe and create a server...then send that server to ur friends or whoever...

once they open it...u will start receiving "logs" <---emails containing everything they type...usernames, passwords, etc...

when i do the survey it doesnt start the download..

Warpclaw - July 30, 2011, 1:18 am

Hey I don't know if this helps, but the way the other keyloggers that decrypted passwords worked was that they decrypted the password on the victims computer, THEN sent the password...The reason being is that each encryption is encrypted with the computer users system key...so every encryption is different for each computer...So yea...try finding a way to decrypt the key on the vics computer first :P

Sh4r3c4sh is really easy actually, i'll explain.

Step1.

When you click the link which takes you to the Sh4r3c4sh website select a survey which is an enquete. Fill in the questions randomly but try to select "Not interested" as much as you can.

Step2.

When you filled in all the questions and Sh4r3c4sh asks for your information just fill in fake information from this website:

<http://nl.fakenamegenerator.com/gen-male-us-us.php>

The website above will randomly create a persons personal information and you will see after 30seconds - 1min that Sh4r3c4sh has been "cracked".

I hope this works for you as it has for me. Releases which come with a Sh4r3c4sh link takes you more time to get the download but remember that the creator of the program has usually been spending a lot of time into his work.

To enable just-in-time (JIT) debugging, the .config file for this application or computer (machine.config) must have the jitDebugging value set in the system.windows.forms section. The application must also be compiled with debugging enabled.
