Thread: [configuring darkcomet w/ DD-WRT](#)

trbman - July 22, 2011, 1:07 pm

I've always loved RATs but lately i haven't been able to use them because my router is giving me so many issues. here's the breakdown

Hardware:

Linksys WRT54Gv5 loaded with the latest beta DD-WRT

What I've tried:

Disabling Block Anonymous WAN Requests (ping)

Disabling Filter Multicast

Disabling Filter WAN NAT Redirection

Disabling SPI Firewall

Turning on UPnP without manually port forwarding

Turning on UPnP with manually port forwarding

Turning off UPnP with manually port forwarding

DMZ my LAN IP

Connection PC directly to moden

What worked:

Connecting PC directly to modem

The only thing that I can think of to try is to stop using beta dd-wrt and downgrade to latest stable version. However, uTorrent has no problem with port forwarding. Nor do any other programs I use. I hate to be dependent on ProXPN. Lately I've just been logging into my neighbors wireless network to mess with my slaves (they have FiOS).

Any suggestions? If I was using standard Linksys firmware, I can see how the router might suck. But given the fact that I have the awesome dd-wrt ? i feel it should work fine.

Are you having an issue for port forwarding?

trbman - July 24, 2011, 8:49 pm

i know HOW to port forward, it just doesn't seem to be working correctly. when i bypass my router it works fine. but when i configure the ports in my router settings, it doesn't work correctly. my friend has stock linksys firmware and it worked fine on his. must be an issue with dd-wrt. i think i'm just going to downgrade to a stable version instead of beta.

Did anyone ever get dd-wrt to work with DarkComit? I am having no luck at all!
