Thread: [\[Code\(s\)\] Save Data Into The .exe!](#)

The-One - September 21, 2009, 11:04 am

Hello HF Members,

Akay, Lets Start!

NOTE : YPN = YourProjectName!

Project > "YPN" Properties

- A New Tab Opens

Click Settings

Click Into The TextBox UNDER "Name" Enter Something Here Like "theone"

Switch back to your form.

Now the codes part :

* I would use it into a button!

Code My.Settings.theone = Textbox1.Text
Code Textbox1.Text = My.Settings.theone
So The First code will Save the TextBox1.Text into the "theone" value.
The Second code will Load the "theone" value into TextBox1.Text

Thanks for reading!

Have fun!

ERROR:

My.Settings.Save = Textbox1.text returns the error:
Expression is a value and therefore cannot be the target of an assignment.

Here is how you do it, without causing the above error. You have to make a string type in myproject.

1. Goto my project
2. Goto settings tab
3. Change the name of 'Setting' to text1
4. Make the 'type' 'string'
5. Make the 'scope' 'user'
6. Make the value 'Save' or shit, anything you want
7. On form1.load type this : My.Settings.text1 = TextBox1.Text (this saves)
8. On button1.click type this : TextBox1.Text = My.Settings.text1 (this saves)

Yes sorry used the wrong name.. Updated

6e756c6c - September 21, 2009, 10:39 pm

Ummm, this topic name is misleading - My.Settings actually saves to files in the Settings folder... o_0 It doesn't directly inject any data into the executable.

This topic is old?

I don't think it's possible to save actually user data into the .exe?
