Thread: [\[HOT \]?\[Tutorial\]Get Apache From A Website\[Working\]\[Telnet\]\[HOT \]?](#)

MaxPain - August 2, 2011, 8:45 am

So welcome to my tutorial by here you will get Simple the apache version of a server and the IP automaticly by using the following commands :

Code telnet website.com 80 - Connect to the website.

Code HEAD / HTTP/1.0 - Command To get the Info

Spoiler [\(Click to View\)](#)

Spoiler [\(Click to View\)](#)

If you want to hide your apache info and you are interested then just post here and then pm.

Just the version of each and then you can use it and find some bugs and execute them then you will be able to get some control and info in your target ?

ex_lumber - September 1, 2011, 7:44 am

nice man, gonna try this

thx thx thx
