Thread: [Question](#)

HF Eboz - August 2, 2011, 5:14 pm

Okay, so I downloaded -WindKeyLogger- & I did a scan on it, only has 1/5 FUD, but I now want to know if it works. So how do I go about testing the keylogger?

if it's 1/5 it's not FUD, it is UD.

(FUD) stand's for Fully UnDetectable, which mean's no AV's pick it up. there is 2 type's of FUD, Scantime & Runtime,

Scantime FUD= Only Undetected when scanned

Runtime FUD= Undetected When Scanned & Ran/Executed

your best bet to test it, is to either find an idiot. or make sure the setting's arent disabling any of your system settings, Registry, System Restore, Task Manager, Etc. and (make sure you remember the installation place to un-install after) and test it on yourself. hope this helped, and goodluck
?

D:\New folder\in logger\keylogger.exe

The parameter is incorrect

HELP ME !!
