Thread: [\[TUT\] Embedding youtube videos into a windows form](#)

**** - August 4, 2011, 4:26 pm

So you want to embed youtube videos into your form, well read on

Step One, the form

Needless to say, open visual studio (or any of the express versions), and create a new windows form application in the language of your choice.

in the toolbox, find the components tab

[img]<http://img688.imageshack.us/img688/2964/flash1u.jpg>[/img]

right click the tab, and click on "Choose Items"

[img]<http://img33.imageshack.us/img33/5053/flash2ny.jpg>[/img]

go to "Com components" and check the box next to "shockwave flash object", than click "OK"

[img]<http://img27.imageshack.us/img27/7563/flash3w.jpg>[/img]

Create a form that looks like this:

[img]<http://img607.imageshack.us/img607/466/flash4.jpg>[/img]

with one shockwave flash object, one textbox (txtlink), and one button

and we are done the form?

Step Two, the code

the movie property is what determines the video played by the shock wave flash object.

so, you would think that the obvious step is to double click the button, and use the following code:

Code AxShockwaveFlash1.Movie = txtlink.Text

however, it will not work.

Why? because this is the link you get from youtube:

Code <http://www.youtube.com/watch?v=kq6HRE0wtYI>

but the component wants links like this:

Code <http://www.youtube.com/v/kq6HRE0wtYI>

notice how the "watch.php" have been removed, and the "=" replaced with a "/"

instead, double click the button, and paste the following code:

Code Dim linkportions() As String

If (txtlink.Text.IndexOf("youtube") <> -1) And (txtlink.Text.IndexOf("watch?v=") <> -1) Then

linkportions = Split(txtlink.Text, "watch?v=")

AxShockwaveFlash1.Movie = linkportions(0) & "v/" & linkportions(1)

Else

MessageBox.Show("Please enter a valid link")

End If

So how does this do?

Code Dim linkportions() As String

creates an array called linkportions()

Code If (txtlink.Text.IndexOf("youtube") <> -1) And (txtlink.Text.IndexOf("watch?v=") <> -1) Then
checks if the link is valid, it does that by checking if the input contains "youtube" and "watch?v="

if the link is valid:

Code linkportions = Split(txtlink.Text, "watch?v=")it splits the link into

Code http://www.youtube.com/and

Code kq6HRE0wtYI

Code AxShockwaveFlash1.Movie = linkportions(0) & "v/" & linkportions(1)this sets the Movie
property into an acceptable like, like this:

Code http://www.youtube.com/v/kq6HRE0wtYI

Now if the link is incorrect, it simply displays a message box saying
"Please enter a valid link"

and how we are done!???

thanks for reading!?

hacku4eva - August 4, 2011, 4:37 pm

thanks for this, can come in handy!

I.V - August 4, 2011, 5:01 pm

Or, just add a webbrowser, get the YouTube URL:

Code http://www.youtube.com/watch?v=QH2-TGUiwu4And remove the

Code watch?v=Then add

Code /v/And we have:

Code http://www.youtube.com/v/QH2-TGUiwu4

Works just as good. But good job on tutorial.

Dally180 - August 4, 2011, 5:38 pm

This could be usefull for auto video viewer programs such as viewet and vagex to decrease the
loading time.

DJ BrU - August 4, 2011, 5:41 pm

I coded one of these in vb6 a long time ago.

Just wanted to point out you can play flash games with it aswell as play videos. Or anything else
that uses flash.

No, I want to make it clear to everyone that WebBrowsers are shit and should not be used.

WebBrowsers are shit and should not be used. Wow, chill your nuts little boy. There is no need for you to jump on the bandwagon for those idiots that do not know the uses for a WebBrowser.

Only because you've read a WebBrowser is bad, you immediately start posting stuff like this about it? Let me tell you, there is so much a WebBrowser can do, which I can guarantee you that you will never be able to do with anything. And that's a deal.

Before jumping to conclusions, and thinking you're pro because you found about a new component, please do think about what you're saying.

Yes, if the developer is an obvious dumb ass and can't use other VB.NET webbrowsers such as WebKite, Gecko and etc... Just making it clear to every one as well.

Not to say IE 9 is actually pretty good now days. ?

I do think about what I'm saying. I am chill as well, from what I've seen, people use WebBrowsers for YouTube Bots, Shell Booters or fail to use them all together. There is a lot of things the default WebBrowser does not contain that it should, that's why most prefer to use GeckoFX or that other one I can not remember at this time.

Oh no, don't worry.. The reply was specifically to me. He does not likes me for reason which I yet do not know. I have PM him asking for what I have done wrong but he ignores me.

Thank you though for the support.

If you would carefully read what I wrote, I'm with you, and I was actually defending you. Sorry if it did not sound like that. ?

You know how to correctly use them. As simple as it is, most don't.

I.V - August 4, 2011, 9:14 pm

(Aug 4, 2011 09:12 PM)Deceptive Wrote: [\[CITE\]](#) You know how to correctly use them. As simple as it is, most don't.

In my opinion the correct way to use them is if there is no other way or any other substitution to it. I agree with you, Webbrowser are a pain in the ass.

But for this tutorial (even though it is very good), I think webrowsers would be a bit better, for this two reasons:

- 1- Serve same function
- 2- No need for extra .dll's

framework - August 5, 2011, 6:35 am

I think we come to a compromise on this, the WebBrowser control is very useful HOWEVER for this program it is impractical because the WebBrowser control loads flash objects with the flash plugin, therefore it is better to just have the "flash plugin" (Shockwave Flash Object) directly on the form.

Lightsout - June 3, 2013, 10:34 am

could this method work for speedtests?

[EDIT] Just Say the Date My Apology
