Thread: [There isnt any decent keylogger.](#)

alhths - August 17, 2011, 6:16 pm

i've tried rin logger and it doesnt send me mails and ive tried skyneos too,i also tried painlogger (the free version) but when i try to send a test mail to my email it simply doesnt send any mail...could you recommend a free decent keylogger that actually works fine?

thanks in advance.

GlaciAx - August 17, 2011, 11:08 pm

It is not problem in the keyloggers, it's problem in you Sir :)

alhths - August 18, 2011, 7:05 am

i dont think so mate...i do everything by word and i have also read every tutorial on those keylogger.and btw im not the only one who has this problem.

Simmerke - August 18, 2011, 10:43 am

true :)

i also experienced problems using those free keyloggers...

The only thing i achieved is some guy's pc messed up.

DillchipHacker - August 18, 2011, 11:11 am

bro, if you'r not getting the test mail its a problem in your computer thats causing it. Maybe have wrong .NET? the free keyloggers, however, mostly suck. sometimes a desent shows up but then in a few weeks its useless like the rest. Remember to only use the gmail you use for hacking to ONLY reseve loggs and delete your test loggs on yourself/friends, copy phaste the "important" loggs into a word document and then DELETE the loggs. and ONLY logg into the mail from a VPN/proxy ip! because the day you get busted your in big trouble. and 100% of the people that use keyloggers sooner or later gets whaled (get the keylogger hacked) so its just a matter of time. And when you have your gmail they also have your IP. So protecting yourself is nr1! Never forget! ;)

alhths - August 18, 2011, 11:26 am

well every keylogger needs .net framework 3.5 or above and i have 4.0 , im also using win 7 ultimate 32bit and i cant figure out whats wrong.

DillchipHacker - August 18, 2011, 11:53 am

Some keyloggers just dont work for windows 7. :(

I guess most programmers use XP and don't understand w7. Although i use w7 aswell and i think i have 100% of the time got the "test-mail", but later on i'v had some other debugging because of using w7(auto-start etc).

You are using Gmail, right?

H????? - August 18, 2011, 11:53 am

- A. Predator Pain sends you the starter e-mail clearly you did something wrong.
- B. If you want a dedicated keylogger, BUY IT.
- C. Don't complain if all you try and the FREE versions.

DillchipHacker - August 18, 2011, 11:55 am

I'm starting to think that you are NyC (Predator Pains programmer) since you are ALWAYS posting about how GREAT it is. wich it isnt.

H????? - August 18, 2011, 12:04 pm

I'm not his programmer. I just stated that it does send the email as he tried to state that it doesn't. I haven't even posted how GREAT it is and I don't adv it.

sdq - August 18, 2011, 2:22 pm

Could be the following reasons:

- 1) Email/pass is wrong
- 2) Smtip server address is wrong
- 3) Port is wrong
- 4) Smtip not enabled in email account
- 5) AV program blocking the sending of the email from your computer

Free keyloggers aren't bad, some of them still have good features. It's just that it's hard to find one that's FUD. Even if there is a FUD one, newbies scan them on VirusTotal or Jotti and the file becomes unFUD very quickly!

alhths - August 18, 2011, 3:02 pm

well when i download a file like a keylogger or so i disable my av so i dont think av is the problem.

Liu Kang - August 18, 2011, 9:17 pm

Predator is weak. If you're going to publish a free keylogger, make it work. I got test emails to work, but the keylogger failed to send me regular keylogged emails.

SMH.

You're an idiot if you say "Don't complain it's free". If you're making a free keylogger, you're branding yourself. What kind of moron would want to have a bad rep when it comes to there free keyloggers? These people who program free keyloggers do it to get noticed. And you don't want to get noticed for the wrong things.

Could you explain 4) to me?

i think all the others are okay so i hope thats the problem :P
