Thread: [Back to school CMD fun \[TUT\]](#)

53CUR1TY - August 26, 2011, 6:47 pm

Hey guys! I know that school just started and I also know how boring this can be, so I have come here to try and make your day a bit more fun using a computer.

Alright first off if you don't know how to open the command prompt, here are a few ways to do it.

One way is to use the task manager if your schools computers gives you access to it.

Quote: Do everything in order.

Ctrl+Alt+Delete > Open task manager > Users > File (New Task... Run) > Type in command.com > hit enter.

Another way is through notepad... most school computers have this.

What you frist need to do is find and open up notepad. After you've done that type this in.

Quote: @echo off

command.com

@echo off After this is done, go and save what you just typed in as anything.bat (IMPORTANT, make sure you save it as .bat or else it won't run).

The first thing you are going to want to do to be able to do all of these commands is gain admin access. To do this, type this in. Quote: start control userpasswords2 Find your username and click Properties, then click on the Group Membership tab and select admin.

Alright so now that you have command prompt open and you have admin. Here are some cool tricks and things you can do on it.

First

Quote: shutdown -i

After typing in that, a small box will appear with a couple of options, most of them are pretty self explanatory, so I will skip to how you shut down a specific computer. First you need find the IP address of the computer you want to shut down. To do this you need to type into command prompt Quote: net view After doing this a group of names will pop up. Alls you have to do is pick a user and do this Quote: tracert (user) Now you have their IP. Go back to the little box that popped up from the shutdown command and do this. Click Add > Enter the IP address of the user you want to shut down. Now you are ready to shut down the comuter. Make sure all of the settings are right and click OK and let the computer do its magic!

Next we will send a message to every computer on the network! This is a very basic command, here it is. Quote: msg \* (message) There, you just sent a message to the whole network for everyone to see!

Here is a quick CMD "proxy" that most of the time works for getting around the website block. This is also very quick and doesn't take too long to do. What you need to do is first find the IP address of the website you wish to go to by typing this in. Quote: `tracert (website name)` A list of IPs should appear, just copy the first IP address that appears and paste it in the address bar and you should be able to get onto that site!

Oh and by the way, if you ever want to clear everything on the command prompt because it gets too messy just type in, Quote: `cls`

Lastly, if you ever get bored of the default white lettering in your command prompt just type in Quote: `color g` And then retype `[quote[ color (color code) [/code] and there! You have a new color that isn't so boring!`

I hope I helped someone of their boredom in school! Please feel free to comment on how the TUT was! (First TUT)

**zenawenliang** - August 26, 2011, 6:50 pm

Dude, I think I just came in my pants, amazing tutorial, but I suggest adding other alternatives so if one of the steps doesn't work.

**53CUR1TY** - August 26, 2011, 6:52 pm

Thanks! And thanks for the feedback! I will keep that in mind in my future tutorials. ?

**GL1TCH3D** - August 26, 2011, 6:54 pm

This looks awesome xD

cmd isn't blocked at my school so I guess I can just go straight to the admin rights part and remote shutdown xD

**53CUR1TY** - August 26, 2011, 6:58 pm

Thanks! Yeah, a lot of schools are different when it comes to who gets CMD and who doesn't

**SLEDGE** - August 26, 2011, 9:48 pm

Very basic, but good for people that are just getting into Command. Nice tut.

**53CUR1TY** - August 26, 2011, 10:40 pm

(Aug 26, 2011 09:48 PM)?odern Wrote: [\[CITE\]](#) Very basic, but good for people that are just getting into Command. Nice tut.

Thanks! I agree it is pretty basic stuff, but it is meant to be for all of the people that are new to CLI

**xToxikx** - August 30, 2011, 9:20 pm

Quote:Quote:

Do everything in order.

Ctrl+Alt+Delete > Open task manager > Users > File (New Task... Run) > Type in command.com > hit enter.

A easier way to do this is Ctrl+Shift+Esc

Nice tutorial :D

**Zebaas** - August 30, 2011, 9:32 pm

My School Blocked Control Panel. So control userpasswords2 Doesn't work. They Also Blocked CMD/Batch, I can use VBScript though...Any Tips on gettin' admin?

**GFX Panda** - August 30, 2011, 10:32 pm

Nice tutorial!! May i suggest using spoilers to contain the code, it makes it look alot more professional.

-GFXP.

**Rhythm** - August 30, 2011, 10:33 pm

This method is older than Jesus, but thanks for sharing!

**Wheelz** - August 30, 2011, 11:24 pm

Pretty cool man I like it, but one question, would your school know that its you doing it? Like if you are signed into your school account Only one thing I noticed is msg \* (message) doesnt work anymore or at least windows 7 also when I try and do tracert then my own computer name it doesnt give me a IPv4, I think its giving me my IPv6, will it still work?

**taikurituima** - September 9, 2011, 6:29 am

This is totally awesome! ;D Im really gonna try these at my school!

**unit56** - September 9, 2011, 1:56 pm

**-Revolution-** - September 10, 2011, 6:12 am

Thank you bro.

Really enjoyed these.

**wag1** - September 10, 2011, 6:14 am

Ow we don't have cmd on our comps :(

**Nechronik** - September 10, 2011, 12:09 pm

it doesnt work for me :( im trying to shutdown my brothers computer but when i type net view it only shows my computer :(

**01871717** - September 10, 2011, 12:11 pm

(Sep 10, 2011 06:14 AM)wag1 Wrote: [\[CITE\]](#) Ow we don't have cmd on our comps :(Made me lol irl... Thats the stupidest thing ive ever heard.

**H4ckThePlanet** - September 10, 2011, 3:06 pm

Not that bad of a TuT! There are so many way's to get around a school's blocks.

**53CUR1TY** - September 10, 2011, 10:12 pm

Yeah sometimes that command doesn't work... I just threw it up there just in case it might work for someone. ?

(Sep 10, 2011 06:14 AM)wag1 Wrote: [\[CITE\]](#) Ow we don't have cmd on our comps :( Every computer has CMD on it, there are just a bunch of different ways to get to it. Also, if you are using a school computer it might be blocked so you need to use a command.com run command through a batch or in task manager. Hope this helped!

**Zebaas** - September 10, 2011, 10:35 pm

Cody, I tried the Command.com on the Computers, Gave me an odd error. Anything else you recommend? I tried:

Regular CMD  
Command.com  
Batch

**Kodbrown** - September 11, 2011, 2:56 am

This is great! Everyone is confused what happened when the computers shutdown :D Nice tutorial!

**bgxcdic** - September 11, 2011, 3:25 am

really basic :(

and this one doesnt work, you need admin right, so dont post junk that fails

Quote:start control userpasswords2 this one is as bad as net user admin password /add  
net localgroup administrators admin /add

**53CUR1TY** - September 11, 2011, 7:51 am

(Sep 11, 2011 03:25 AM)bgxcdic Wrote: [\[CITE\]](#) really basic :(

and this one doesnt work, you need admin right, so dont post junk that fails

this one is as bad as net user admin password /add

net localgroup administrators admin /add

Kind of a bold statement to call it 'junk that fails'. Your just jumping to conclusions because it didn't work for you.

Anyways, if you are trying this at school then there is a chance it might not work because your network admin might be a little bit smarter than others. Not all of these are 100% guaranteed to work.

**bgxcdic** - September 11, 2011, 3:32 pm

its built into windows xp and vista and 7 not to work  
???

if your school is using anything other than those or a linux distro, it needs an upgrade bad!

**Andonn** - September 17, 2011, 2:56 pm

hi my i cant put in the ip the active directory domin services is not working plzz send me a link to download nice totorial

**Rets** - April 24, 2012, 11:21 pm

The shutdown -i doesnt work for me. Access denied (5), even tough i run as admin. Any one know why this happens?

**broski98423** - April 25, 2012, 5:52 am

very well explained.

THANKS BRO! :D

**herrdeutschland** - April 30, 2012, 10:41 am

very nice tutorial dude ,can u please tell me if there is a way that i can msg someone specific in the network ??

thanks a bunch

**Harry Dresden** - August 20, 2012, 8:11 pm

Most of these are too simple for my school.

Easier way for me was to fuck up a computer and install a keylogger.

When an admin came to fix it, I got his pass.

**THUG x WRECK** - August 20, 2012, 9:22 pm

Command.com is the 16-bit command interpreter which is no longer used in favor of the 32-bit NT flavor CMD.exe

**Robilud** - August 27, 2012, 3:01 am

Nice tutorial! I was trying to remote shutdown trough CMD a long time, never got it to work. This will be awesome when school starts again. ?

Alright first off if you don't know how to open the command prompt, here are a few ways to do it.

One way is to use the task manager if your schools computers gives you access to it.

Another way is through notepad... most school computers have this.

What you frist need to do is find and open up notepad. After you've done that type this in.

After this is done, go and save what you just typed in as anything.bat (IMPORTANT, make sure you save it as .bat or else it won't run).

The first thing you are going to want to do to be able to do all of these commands is gain admin access. To do this, type this in. Find your username and click Properties, then click on the Group Membership tab and select admin.

Alright so now that you have command prompt open and you have admin. Here are some cool tricks and things you can do on it.

First

After typing in that, a small box will appear with a couple of options, most of them are pretty self explanatory, so I will skip to how you shut down a specific computer. First you need find the IP address of the computer you want to shut down. To do this you need to type into command prompt After doing this a group of names will pop up. Alls you have to do is pick a user and do this Now you have their IP. Go back to the little box that popped up from the shutdown command and do this. Click Add > Enter the IP address of the user you want to shut down. Now you are ready to shut down the comuter. Make sure all of the settings are right and click OK and let the computer do its magic!

Next we will send a message to every computer on the network! This is a very basic command, here it is. There, you just sent a message to the whole network for everyone to see!

Here is a quick CMD "proxy" that most of the time works for getting around the website block. This is also very quick and doesn't take to long to do. What you need to do is first find the IP address of the website you wish to go to by typing this in. A list of IPs should appear, just copy the first IP address that appears and paste it in the address bar and you should be able to get onto that site!

Oh and by the way, if you ever want to clear everything on the command prompt because it gets to messy just type in,

Lastly, if you ever get bored of the default white lettering in your command prompt just type in And then retype [quote[ color (color code) and there! You have a new color that isn't so boring!

I hope I helped someone of their bordem in school! Please feel free to comment on how the TUT was! (First TUT)

[/quote]

Outstanding tutorial, gives me something to look forward to next period in tech class. If all goes well, mass message is for me, every person on the network will get this message. "I think I have pointed out some loopholes in the network, when you find me... well if you find me, we shall have a good talk about it."

**ASDA** - August 27, 2012, 5:19 am

CMD wasn't blocked in my school... Then I got admin access and 'accidentally' shut down the network. I have no use for this, anymore :(.. Good tutorial!

**DaNet** - August 27, 2012, 6:09 am

The last time i hacked my school, i was arrested, so no, thanks :)  
But a good tutorial, also.

**N?sty** - August 27, 2012, 7:30 am

I don't really feel like risking it, not worth the trouble you can get into.

**deputy.** - August 27, 2012, 7:34 am

In my school we have expensive Macbook Pro's. No cmd prompt for me

**Ultrysandbox** - August 27, 2012, 7:56 am

Instead of msg\*(Message)

try this net send (computer name)

**53CUR1TY** - *August 28, 2012, 2:36 pm*

Just checked out this old thread I made, I'm glad some of you are enjoying it.

Would you guys like to see a more updated version with some more information in it?

**Five Finger Death Punch** - *August 28, 2012, 5:22 pm*

Tomorrow i am going to have a fun day at the computer lab :D
