Thread: [\[TUT\] Check if a website is up or Down \[EASY\]\[SOURCE CODE\]\[VB.NET\]](#)

Gr0wlit - September 6, 2011, 1:33 am

Hi all, i've searched in the forum but i haven't found this so please, don't flame if this is already posted...

In this tutorial i will teach you how to check if a website is up or down. Yes, you can use <http://www.downforeveryoneorjustme.com/>, but if you love to programming, you will be happy to do this!

LET'S START!

In this example i will not work on the gui of program, that is your work!

In your form1, add:

1 Button;

1 Textbox;

1 Label (set Text = "");

You will have a project like this:

http://img16.imageshack.us/img16/470/form1p.png[/img]

ok, now, double click on the button and add this code:

```
Code Dim str As String = New WebClient().DownloadString(("http://downforeveryoneorjustme.com/"
+ TextBox1.Text))
If str.Contains("It's just you.") Then
    Label1.Text = "The site is Up!"

ElseIf str.Contains("It's not just you!") Then
    Label1.Text = "The site is Down!"
Else
    Label1.Text = "No Website!"
```

End If

You will have an error on WebClient, yes because we need to add in the namespace the reference on system.net, so above the Public Class Form1 add:

Code imports system.net

WHAT HAVE WE DONE?

This is a spieagation step by step:

```
Code Dim str As String = New WebClient().DownloadString(("http://downforeveryoneorjustme.com/"
+ TextBox1.Text))INTRODUCTION: If you go to the website
http://www.downforeveryoneorjustme.com/ and you try to verify if hackforums in online or offline, you
will see that the address is http://www.downforeveryoneorjustme.com/hackforums.net.
```

So We have declared a string variable named str. This string contains all of the words that there are on the website <http://downforeveryoneorjustme.com/> thetextofthetextbox1. If we go to the site we see that looks like:

http://img84.imageshack.us/img84/4782/ssssut.png[/img]

```
Code If str.Contains("It's just you.") Then
```

```
Label1.Text = "The site is Up!"
```

If in the set of words that our program have downloaded there is the phrase "it's just you" (look the image above), then the label 1 will say that "the site is UP!";

```
Code Elself str.Contains("It's not just you!") Then
```

```
Label1.Text = "The site is Down!"
```

if in the set of words that our program have downloaded there is the phrase "It's not just you!" (This appear when there is a site down), then the label 1 will say that "The site is down!"

```
Code Else
```

```
Label1.Text = "It isn't a website!"
```

Just a little clarification, if we put in the textbox "sduifdiubi", the label1 will say that it isn't a website!

CONCLUSIONS

So, this is all, you can customize your program as you want, you can for example change the color of the label based on the results obtained. For example:

```
Code If str.Contains("It's just you.") Then
```

```
Label1.Text = "The site is Up!"
```

```
Label1.ForeColor = Color.Green
```

You can implement this tool on other your tools for improve the quality of the software!

SOURCE OF THE FULL PROGRAM:

```
Code Imports System.Net
```

```
Public Class Form1
```

```
Private Sub Button1_Click(ByVal sender As System.Object, ByVal e As System.EventArgs)
```

```
Handles Button1.Click
```

```
Dim str As String = New WebClient().DownloadString(("http://downforeveryoneorjustme.com/" +  
TextBox1.Text))
```

```
If str.Contains("It's just you.") Then
```

```
Label1.Text = "The site is Up!"
```

```
Label1.ForeColor = Color.Green
```

```
Elself str.Contains("It's not just you!") Then
```

```
Label1.Text = "The site is Down!"
```

```
Label1.ForeColor = Color.Red
```

```
Else
```

```
Label1.Text = "No Website!"
```

```
Label1.ForeColor = Color.DarkCyan
```

```
End If
```

```
End Sub
```

```
End Class
```

This is all, as you can see, this is a very simple program, i hope you like it, if not, please, don't flame!

BreastMilk - September 6, 2011, 1:58 am

um.... Thanks Sure Some People Will Find This Useful! :)

GayFish - September 6, 2011, 2:02 am

well it's a good idea i suppose but it's downforeveryone's idea....but still this increases the functionality of it.

Thanks for the TUT

Iuv. - September 6, 2011, 2:04 am

or go to isup.me

which will take 5 seconds.

Fake. - September 6, 2011, 2:07 am

Use isup.me, shorter domain.

Input downforeveryoneorjustme.com into your app and it returns "No Website!"

Input isup.me and it returns "The site is Down!", when in reality it is up (same site, diff URLs).

Just two things for you to consider.

GrOwlit - September 6, 2011, 2:12 am

Just two things for you to consider.

If i put downforeveryoneorjustme.com into my app it says that it is ONLINE, but yes, if i put isup.me, it says that is offline.

And sorry, why i need to use isup.me? when open this app you only need to put for example google.com in the textbox, nothing else!

Ah my bad, didn't see it in the title tag.

isup.me is shorter than downforeveryoneorjustme.com, that's all.

IIIBeBackSoon - September 6, 2011, 5:37 am

Just do:

```
Code Dim Client as new WebClient()  
Try  
Client.DownloadString("URL")  
Label1.Text = "It's up"  
Catch ex as exception  
Label1.Text = "It's down"  
End Try
```

(Sep 6, 2011 05:37 AM)Simran Wrote: [\[CITE\]](#) Just do:

```
Code Dim Client as new WebClient()  
Try  
Client.DownloadString("URL")  
Label1.Text = "It's up"
```

```
Catch ex as exception
Label1.Text = "It's down"
End Try
```

If you do this you must put in the textbox the full URL like
Code `http://www.google.com`

In the program that i've wrote, you can simple put google.com, just a little confort, but the program do the same thing and the code is long equal.

Thank you for your post ;)

Tutsu - April 28, 2012, 2:12 am

thx bro helped me out :) does any1 know how to do it for an ip as well?

Coleak - April 28, 2012, 2:29 am

Seems like there is a lot of code for something you can litterally do in a single line of code.

If New

```
System.Net.WebClient().DownloadString(String.Format("http://downforeveryoneorjustme.com/{0}",
TextBox1.Text)).Contains("It's just you") Then MsgBox("Online") Else MsgBox("Offline")
```

```

lol, why you've read a thread of 1 year ago? :) There are a lot of others threads made before and after this, i'm sure someone else have done it like you say. This was one of my first tutorials:)

```

Why on earth would you put all that in a single line?

Fake. - April 28, 2012, 5:29 am

Not to mention reinstantiate the webclient every time the method is called.

ThrillerCloud - August 13, 2012, 9:30 pm

ok the error i get is when i put google.com in the text box i get the site is down ?

never mine it dos it on the website aswell so never mine xD
