Thread: [\[TUT\] Making Your Menus Load Faster!](#)

Rexagon - September 6, 2011, 6:55 pm

This is one of my favorite tweaks as it makes a huge difference to how fast your machine will 'feel'. What this tweak does is remove the slight delay between clicking on a menu and XP displaying the menu.

Go to Start then Run

Type 'Regedit' then click 'Ok'

Find "HKEY_CURRENT_USER\Control Panel\Desktop\"

Select "MenuShowDelay"

Right click and select "Modify"

Reduce the number to around "100"

This is the delay time before a menu is opened. You can set it to "0" but it can make windows really hard to use as menus will open if you just look at them - well move your mouse over them anyway. I tend to go for anywhere between 50-150 depending on my mood.

Tutorial 100% by Mojang, Do not redistribute :3 PM me any questions or concerns!

Seems like it worked, interesting...

Spoiler [\(Click to View\)](#)too shot and stuff like that

Waka Flocka - September 7, 2011, 12:36 pm

doesnt seem to do anything on my w7

Tacitus - September 7, 2011, 3:46 pm

He does mention XP...

Also I prefer not to mess around with my registry to much.

I recommend making a backup of your registry before you do this. ;)

davidbaole - September 8, 2011, 11:36 am

well, i tried it and it feels the same haha ><

Rexagon - September 8, 2011, 1:28 pm

Its more for slower computers, i guess! And yes, make a backup if your that paranoid!
