Thread: [\[2\] http://exocetmaster.fr/ \[DEFACED USING mBot Automated exploitation \]](#)

Domain: <http://exocetmaster.fr/>

Shell: <http://exocetmaster.fr/shelled.php>

I could've shelled the main website, but for educational and POC purposes, I made a subdirectory tree, so that the shell lives longer. And the POC stays up longer.

mBot is short for monetizebot, and does exactly what the name says.

It is a [HTTP] bot that auto exploits servers using different types of attacks including:

SQLI

RFI

LFI

webdav

Using sophisticated algorithms, it digs it's way through the web on a victims computer, exploiting vulnerable websites.

The profit of this is, that the algorithms are random. It will go through completely differen websites on each pc you infect.

So the more victims you get on mBot, the faster you will see valuable shells rolling in.

BUT THAT's not all, mBot has way more features, find the complete list here:

mBot - Automated exploitation and monetization.

That looks very nice, I take it you're meant to replace "shelled.php" with an actual shell though?

Yes this is only POC, we do not mean to harm the server.

So we upload a harmless php, that will show that mBot has managed to hijack the server on its own, and upload a file.
