Thread: [Mouse/Keyboard will not wake up from sleep/hibernate.?](#)

Ruzlier - September 8, 2011, 7:16 pm

I have a razer lycossa/lachesis, when I try to wake them from sleep neither wake up. I had issues before with the computer hibernating[where nothing woke up] but I got a new power supply (for an unrelated incident) and since then it has worked. They will work,only, I have to unplug them then plug them back in, they do not directly wake up.

Techie??? - September 8, 2011, 11:21 pm

Can you please explain this with good grammar etc.

Little Hippo - September 8, 2011, 11:23 pm

turn it on and off, check the battery and see if the connection has been established. or you mightve gotten a virus that disconnects it. idk

I do not know how else to explain it. Ill try this

My mouse doesn't wake up from when I put the computer to sleep.

You know, the thing that moves the cursor around. The cursor is the little pointer thing on the computer screen.

My keyboard doesn't wake up either. The keyboard is the thing that types.

Neither of them are. I doubt it's a virus, because I haven't actually put the computer to sleep with the keyboard/mouse before, The first time I tried to wake my computer up from sleep using them they didn't work.. So it's probably an issue with them.
