Thread: [Port Forward - Linksys](#)

?Q - September 22, 2011, 3:36 pm

I'm trying to port forward, I have a Linksys router, but when I type the IP into my web browser, it won't load. So does anyone know how to fix this? I tried it with several browsers and none of them worked for me.

Thanks.

Assuming you know how to portforward once you get to the panel. Open run and type cmd or open it manually from Start > All Programs > Accessories > Command Prompt. Once ur in command prompt type ipconfig /all look for default gateway and type that address in your browser :p

That's what I did, but it didn't work. And my default gateway is 10.0.0.1 Which doesn't look "real"

Try turning off Hamachi/ and or other LAN programs such as Tunngle. Also try disabling any extra network adapters enabled.

And when u type in ur browser dont type http:// just type the gateway

I don't have any LAN programs on, but I've heard there is some problems doing this with Linksys routers...
