Thread: [Shell booter,http booter and putty booter](#)

Poster Boy - September 28, 2011, 10:35 am

Hello everyone.I have seen people selling various booters like shell booters,http booters and putty booters.Can someone please tell me what is the difference between them??I also want to know what is advanced shell rotation which is used in shell booters.

`00Synch_ - September 28, 2011, 11:47 am

A shell booter is an interface that displays all DoS shells associated with it. A DoS shell is a PHP script uploaded to some form of hosting. An HTTP booter is an online booter. A PuTTY booter uses an interface similar to CMD, and is connected to a VPS. Instead of using the VPS(a form of hosting) directly, PuTTY allows a user to use the VPS and DoS directly from their desktop. Be sure to know the difference between DoS and DDoSing. A DoS is a single action, such as one shell. A DDoS uses bots, or multiple shells to attack. For more information, check out the Botnets section [here](#).

if you want a recommendation on which one to use i would go with a client booter due to it seems to be your first time i would recommend using biozombie or xr (simple to set up) if you want a little better of one i would use metus 2.8 and is what you do with the client once it is set up is you use multiple connections you have either purchased or got by spreading to all attack one ip otherwise known as ddosing i am somewhat new to ddosing so im not the best to learn about it from so heres a link. <https://hackforums.net/showthread.php?tid=112221&highlight=metus+delphi> this is to setup metus

i would not recommend shell booters because they are crap unless you make your own and use it right other wise they have no power the post says 700 shells about 5 are working and as for web shell booters they are normally down because kids hit off the website or the website is hit by a rival booter.

ShellBooter: Uses shells to DDoS (Masive DoS) the target, it is the best option for XBL/PSN/Home Internet Connections, it has shell rotation to keep the shells alive more time and increase the power

Putty: Is a Perl/Nix script that is added in a VPS to perform a DoS attack, as it do not performs a massive DoS (DDoS) maybe the power will be limited.. better for small websites and maybe XBL/PSN (Due it boot time), it do not have shell rotation as it is only a script that DoS and do not use shells

HTTP Booter: Same as ShellBooter but web-based..

Depends on the speed, they do a good job on home connection and XBL/PSN if the speed of the VPS is good. If not i recommend a normal Web Booter for that job

Don't make a booter they are pure shit. If your interested in DDoSing people the correct route you should take is making a botnet. In the end botnets are way stronger then any booter could dream of being. They also have an unlimited boot time unlike booters. However I guess if your looking to make money you can jump on that skid bandwagon and make one, they are actually very easy to make. I am also pretty sure there's a tutorial about making each one on this site.

Yes, botnets are best than booters and putty booters, but it is more difficult because you need to spread, etc, etc.

Go to botnet section and learn from there

Tip: Do not use VertexNet or Cythosia, they svck

Myth - October 12, 2011, 5:11 pm

putty's fuckin suck, they die in a few days.

OGstarZ - October 12, 2011, 6:25 pm

for a shell booter you have to make shells to take kids offline by webdav exploiting and a putty booter is simple you just need to buy a good vps then run it on putty and u can put like a certain script on there to flood kids internet on xbox or whatever
