Thread: [\[Source\] Anonymous E-Mailing \[VB.NET+PHP\] \[Simple\]](#)

Funhouse - September 29, 2011, 5:39 pm

Hey Hack Forums! I'm here with another little source code that I made up. This source code allows you to send anonymous e-mails from any e-mail you can think of. This is extremely basic, and I suggest that before you use it, you should edit it to make it more sturdy.

Download: [Click Here](#)

Here's a basic overview on how to use it.

Inside the .zip, you'll find a PHP and a VB.NET folder.

You're going to need to upload the PHP folder's contents to a free hosting provider (SPAM, BinHoster, etc.).

In the VB.NET application, find the line that says:

```
Code b.Navigate("http://yourhosting.com/mail.php?to=" + TextBox1.Text + "&from=" +  
TextBox2.Text + "&subject=" + TextBox3.Text + "&body=" + TextBox4.Text)
```

Change "yourhosting.com/mail.php" to the link to your mail.php that you uploaded from the PHP folder.

That's pretty much it! The application works by using a webbrowser (you can use webrequests if you'd like. I threw this together pretty quickly, webrowsers are faster.) to visit the PHP file and set the variables in the PHP file to the textboxes on Form1. Then, the PHP file uses mail() to send your e-mail!

Anyways, I know this is really simple, but I figured that it'd be helpful to some members of HF. I always appreciate feedback, so make sure to reply with some!

Much appreciated! Although I am of no high standing in the forum I can confirm that the download is a clean one.

Fake. - September 29, 2011, 6:00 pm

a) You are not encoding the URL. If there is say an & in your body then the remaining body content will be excluded.

b) The GET method has a limit. Consider using POST instead.

Funhouse - September 29, 2011, 6:45 pm

The download is a source code and a PHP script. Of course it's clean. :P

Also, I said that it was far from ready to be released. I said that you should edit it, and seeing as how you know what the problems are, it should be easy for you. c:

diosdelared - September 29, 2011, 8:58 pm

.... A little problem you cant make mailing from SPAM but good try lol you need a hacked or pay host

The other example allows you to send mail.

Menalix - September 30, 2011, 3:10 pm

This has almost nothing to do with VB. Post it in the PHP section, and remember to don't use simple shit like this on your host if they don't allow they will ban you fast :)

BreastMilk - September 30, 2011, 3:32 pm

I think you would have been better off making a nice TUT on how to do this. Not Placing a download link to the source on the thread just posting the anti copy and paste pictures so People learn how to do it.

Funhouse - September 30, 2011, 8:55 pm

Jesus fucking Christ, nobody can just comment on the source, without just looking for something to rank on? The main application uses VB. BinHoster allows e-mailing. I didn't feel like writing a tut.

joneh heil - July 27, 2014, 1:05 pm

Could you please update the link? I need this :)

Can you fucking stop gravedigging? You moron.

joneh heil - July 27, 2014, 1:30 pm

Eu ma gahd. I got this recommended in another thread. Didn't look on the date.

(Calm your titties by the way)

X3R0 - July 27, 2014, 2:38 pm

this thread is in 2011 sorry didn't notice it till now
