Thread: [\[TUT\] Staying Anonymous on The Internet and Other Related Things \[TUT\]](#)

Username1024 - October 9, 2011, 1:12 am

So, you finally hack that site that you've been trying to do so for 3 weeks now.

And then the mothafucking POLICE show up at your door.

We don't want the [Party van](#) to ruin our party, out of all the things, do we?

There are some things that you can do to slow down the process of getting caught, or possibly even never getting caught!

Learn how to use a proxy. I recommend you use Socks5, and possibly even buy them. I can highly recommend vip72.com. They have cheap prices, and high quality. A tutorial for using Socks5 proxies with Firefox can be found [here](#), and one for Chrome can be found [right here](#).

Use a VPN! Don't just stick with a free one - save up the money and buy yourself a good one. The difference can be going to jail or going out to party. Make sure that the VPN you choose to purchase does not keep logs, and that it is preferably offshore as well.

Do not brag about your accomplishments. You never know where those chat logs can turn up, or whether your best friend at school is a snitch.

Use disk encryption! I cannot stress this enough. If you do not know what this is, [this Wikipedia article explains it pretty well](#). If you have no money to spend, try out [Truecrypt](#). Make sure your password is long. The longer it is, the harder it is to bruteforce.

Do not use the same password you use for Facebook as you do for Truecrypt. Make all of the passwords to "sensitive" documents brand new passwords.

Do not ever admit to anything, no matter what country you're in.

This may be a rumor, but I find it helpful. Try hacking in a virtual machine. Make sure it is encrypted and has a password set on it to start it up, and then install Truecrypt in the VM as well. It is just another layer of protection.

Make sure you are clear of all malware. You don't want anybody, law enforcement or other hackers, watching what you are doing. ?

When you infiltrate a system, leave no traces. Delete all logs you created, do not forget to delete files you create, etc.

Use [Pidgin](#) with the [OTR](#) plugin. It encrypts all of the messages you send whilst in a private conversation, has unique fingerprinting, and allows you to ask a question of your choice and receive an answer back before you even start talking. Note - both people must be using Pidgin with the OTR plugin.

DO NOT BE DUMB WITH YOUR DOX! Never sign up on sites with your legit information. I can recommend [FakeNameGenerator](#), it is a great site with some awesome features. It generates names, addresses, etc. to create your fake dox.

If you must hack from home, clear your router logs. The smallest amount of evidence can be crucial in a court case.

Periodically delete your system logs. A simple Google search will teach you how to do this.

If you plan on doing anything very, very bad I recommend the chain of..

Laptop -> hacked Wifi (with spoofed Mac address, out of view of any cameras) -> VPN (no logs) -> RDP -> VPN (no logs) -> Socks5 -> PHP Proxy -> whatever the FUCK you're doing that needs this much protection (CP, bank accs, etc)

Sorry if the tutorial seems rushed - I was bored and had nothing better to do. It's nothing new, but I just wanted to write a tutorial. ?

? |?ncrypTOr | ? - October 9, 2011, 2:04 am

Good tutorial, but there are already thousands of similar

i was trying to read your article but couldn't do it after half way because i was distracted by the massive red and blue POLICE

:3

m317down - October 9, 2011, 3:51 am

Nice, tutorial, its short and sticking to the point

Hahahahaha I was distracted by it too. But really good tut, its simply stated and everything is put into terms that even the most illiterate beginner could understand. If anyone follows this tut and still gets caught, you just need to stay away from hacking all together.

JiN1337 - October 10, 2011, 10:35 pm

Suggestion. Why not destroy your hard drive, and run your OS from an SDHC card? That way, you can literally either stomp the motherfucker to pieces, or eat the fucker. (Have fun shitting that night though.)

Not everyone has an SDHC card. If you're doing anything hacking wise, why not just install a Linux distro to a CD, live boot it, and if law enforcement comes, just turn off your computer and break the CD?

Same concept, one is just easier done than the other. ?

Obs3rv3r - October 12, 2011, 4:50 pm

Thank you. Very nice and informative tutorial.

Clones - October 13, 2011, 2:39 am

This is really a very nice thread, thanks for sharing with us :)

fnatices - October 13, 2011, 9:52 pm

police will arrest u or charge u? how much will it charge u when u get caught and all those?

Maven - October 14, 2011, 12:39 pm

Nice tutorial... was informative and made me laugh ?

Username1024 - October 14, 2011, 1:45 pm
