What must I be doing wrong?

I follow the guides for each and every client manage to spread it but never get no installs?

I crypted each server this is the only place i could be going wrong...

phybe? - October 17, 2011, 3:52 pm

Are you sure you portforwarded correctly and have you been using the same crypter or have you tried different ones?

dewkal - October 18, 2011, 12:24 pm

Not tried different ones, I need to make some money somehow and buy a decent one :(

hmm maybe i should just try to infect my other laptop

Rukkas - October 18, 2011, 12:47 pm

Some Crypters have dependencies like ones coded in vb6 or vb.net, the victims would have to have a .net framework installed. That could be a problem. Also, I would check the ports you are using, the DNS name you are using for NO-IP, and double check all passwords and settings through out the server build process.

dewkal - October 19, 2011, 2:10 am

Thanks Rukkas, I do believe its the crypters im using.

Will carry on!

Vuln - October 19, 2011, 3:28 am

.. Then what crypter/RAT are you using?

rockito - October 19, 2011, 4:11 am

im got same problem why this? ?

Pirate - October 19, 2011, 6:20 am

Try running the unencrypted server on your own PC or in a Virtual Machine with the respective server settings. If it works correctly , then the server file is made perfectly. And then try running the server file again after crypted. If it doesn't pop up any info , then probably the crypter may corrupted your server and/or it may be the dependencies problems as Rukkas told.

Hope it will help. :)

Solar_Flare - January 30, 2012, 2:43 pm

Same issue, However I think Rukkas hit it right on the nail, Client need's .net installed.

W00F - January 30, 2012, 3:36 pm

You could always get a RAT/crypter that isn't .net dependant. Have you made sure your ports are working 100%? Make a new harmless server and test it on yourself, or test on a RDP or virtual environment.

ProCydia - June 25, 2012, 9:28 am

Try running the ucryted server and see if it works, if not, you might have port forwd wrong.

If it does but not when crypted, when you crypt, it messes up the server.
