Thread: [Would you buy a spoofing service for your Perl DoS, aka "Putty Booter?"](#)

unflappedacorn - November 22, 2011, 3:18 pm

I've noticed so few VPS owners spoof their IPs when launching attacks, some of the ones that do spoof turns out to be really successful like RebelSecurity and Orgy's \$300 spoofing service, although this is probably less efficient since I've never seen their source.

Advantages of spoofing

- it becomes MUCH for your vps hoster to ban you.
- attacks become significantly stronger.
- it's almost impossible to trace the attack back to you (hides the ip of your vps by using a range of IPs)

Some info on spoofing:

<http://rmeijer.home.xs4all.nl/spoofing.html>

This takes me about 10mins to setup. Would anyone be interested in this? And what would be a fair price be? \$5? It is really pretty simple. I would do this over teamviewer of course and install all the necessary modules on your vps. I will give a free demonstration to a trusted member when I decide to sell this service.

SYN spoofing:

Orgy - November 22, 2011, 3:51 pm

Can you prove that your spoofing actually works? I doubt it does, considering that most hosts don't actually allow IP Spoofing.

unflappedacorn - November 22, 2011, 7:00 pm

Currently testing a DNS based attack where it uses the requests of google to amplify the attacks on the target.

Would love to have someone test this for me via teamviewer. Save me trouble buying vps's, and saves you time doing this yourself.

Pm me :)

Orgy - November 22, 2011, 7:05 pm

y u no answer my question?

you closed your thread earlier to test, but reopen with no results?

unflappedacorn - November 22, 2011, 7:08 pm

you closed your thread earlier to test, but reopen with no results?

1) One member messaged me that I was going to test with but I was unable to contact him, so no results.

2) I'm limited by what I can test at the moment since I'm working on a college campus and would not risk doing any blackhat activity.

3) I'm really not expecting too much out of this, as seen by the \$5 price tag if it does work, so yeah lol. ?

.Infinity. - November 22, 2011, 7:09 pm

How does spoofing automatically increase the power of your attack? ?

TeemoProd - November 22, 2011, 7:14 pm

You act like spoofing increases the power. And a majority of the VPS's these users would have wouldn't permit IP spoofing.

It sends massive requests to large sites such as google, which google then in turn sends more data to the victims.

It's just a small thing I'm trying out, I know it's not gonna be at the level of success as Rebel, look at my \$5 pricetag (if it even works) compared to your \$1200 price tag. But i'm just really interested and learning as much as I can in the meantime. So no hate k?

TeemoProd - November 22, 2011, 7:17 pm

I'm not hating, I just want you to actually know how ineffective it will be.

I know it might be worthless right now, hence why I didn't even BOTHER starting a sales thread. But i'm working on it and consistently bothering my comp. science professor about it, for educational purposes of course.

TeemoProd - November 22, 2011, 7:27 pm

Let me know how consulting your professor goes, should open an e-blog about it. Possibly write a book on it.

unflappedacorn - November 22, 2011, 9:16 pm

Lol insult me, w/e, but I know it spoofs the ip, although I haven't been able to test its power yet
