Thread: [x7 Filehosting Cracker, multi socket/fast rps/perfect for ppl new to cracking](#)

?K47 - November 22, 2011, 10:11 pm

Been sharin a few of my crackers lately on the forum, trying to get ppl more interested in the art of password cracking and see that it can be a very effective method for obtaining accounts without changing the original password.

This is a basic, super easy to use password cracker for cracking x7.to filehosting/sharing accounts. No Proxies or messing with server configurations needed, just load up a list of user names and a good password list and your good to go.

Does have some extra password options like running the user as the password and adding a character before or after each of your passes.

For your sockets you can just leave it at 20....if you have high speed connection you can push it up to 40-50 max safely (if you push your sockets to high for your connection your cracker will skip)

This is a good cracker for any of you who are new to password cracking and want to see how a cracker works & actually cracks accounts....these x7 accounts haven't been molested by the cracking scene so they are very easy to crack (I hit over 20 in the 1st 5 minutes on only 2 passes)

If anyone's got questions feel free to hit me up wit em.

(I've added a download for 2k user accounts for you to load and an 88 common password list to give it a shot)

Hey how did you make that can you release a cracker for cracking hotmail with using smtp,i have heard that this method works to crack.

Best of luck with this cracker

Best of luck with this cracke

smtp is the worst server to use for cracking hotmails or any email for that matter to be honest....when cracking hotmails you have to think about captcha and account lock outs which hotmail has both so finding a method for a cracker to run on is not the simplest task....the last working public hotmail cracker I used ran off their <http://login.live.com> server, it could only run 5 passes at a time tho due to accounts being locked after 5 incorrect pass attempts so it was strictly a backwards cracker..I do currently have a working hotmail/msn/live cracker with a private method that beats captcha and account lock outs allowing me to run as many passwords as i want on as many emails as i want....but I had to drop quite a few billz on this cracker....basically you get what you pay

for homie.
