Thread: [Finding Something That Can HOLD Huge Number of Bot](#)

Invulnerability - November 27, 2011, 8:17 am

Hello guys, i need to find something that are very STABLE(Does not lose victim easily) in holding huge number of bot

I don use it for dos, i just want to backup my victim(Good for Bot seller)...(Can be in Http bot, IRC, RAT)

I wan at least have a Download and execute function & Very Stable in holding Victim

Any idea? Just post what you know

I_am_DdoseR - November 27, 2011, 8:24 am

www.Hostbooter.com - Host it on Dedicated server and enjoy. Can Hold 10k bots without any LAG and Losing stability.

Also - Http,Udp,Slowloris,Syn,Bandwith drain attacks . Can take down everything with big amount as u say.

Enjoy fun , no it's paid.

Using it for free can only me , rulezzz. i AM God of HF, And yes i use everything for free which is paid.

/thread

/Ok

/now i am leaving to troll someone.

Bb

Bb

Can i host it on my own computer?

When i need the bot, i will open it up like Darkcomet

Sry quite new to this thing

I_am_DdoseR - November 27, 2011, 8:39 am

Yes you can host it on your PC, you can hold 5-6k bots on own PC.

It's ddosing like beast, best bot on HF.

IRC Bot - Old sucking ololo, IRC Protocol sucks for botnet.

Http and p2p - Biggest botnets are http and p2p but on HF you will not find something really good like Zeus,Armageddon,Dirt Jumper, spyeye and ETC. Only school bots like autumn.

One bot u can normally use for holding/ddosing is Hostbooter. + it has a botkiller.

Buy it .

Botkiller means - It kills ALL Bots on your victim and the victims are only yours(fresh)

other kid's bots are killed by hostbooter.

It's price is 35\$

_Gorhax - November 27, 2011, 8:51 am

You won't ever get a huge amount of bots so don't worry about it.

SwagMonster - November 27, 2011, 8:56 am

(Nov 27, 2011 09:51 AM)_Gorhax Wrote: [\[CITE\]](#) You won't ever get a huge amount of bots so don't worry about it.

Hahaha. Oh wow. Well, aren't you a douche.

_Gorhax - November 27, 2011, 8:59 am

(Nov 27, 2011 09:56 AM)SwagMonster Wrote: [\[CITE\]](#) Hahaha. Oh wow. Well, aren't you a douche. I'm just telling it how it is. Do you seriously think OP will ever get a huge amount of bots? He is considering using a hostbooter to hold the bots and then run it from his home connection ffs..

Invulnerability - November 27, 2011, 9:04 am

Yes i also don think i will get alot of bot

So any suggestion?

I_am_DdoseR - November 27, 2011, 9:06 am

(Nov 27, 2011 09:59 AM)_Gorhax Wrote: [\[CITE\]](#) I'm just telling it how it is. Do you seriously think OP will ever get a huge amount of bots? He is considering using a hostbooter to hold the bots and then run it from his home connection ffs..

Hf is 90% from skids , using shellbooters and etc. Also schoolbots like autumn and 90% 20 TH CENTURY OLD IRC BOTNET METHOD

AHAH))

The best one is hostbooter.com to host on VDS for Hackforums member.

?

Invulnerability - November 27, 2011, 9:18 am

Vertexloader it is Stable to hold victim?

I_am_DdoseR - November 27, 2011, 9:24 am

Vertexnet sucks like 99,9% of HF bots, read my post and buy it .

Or Take Zeus botnet and hold bots on it , but this is not for noobs.

/thread

lo0ol - November 27, 2011, 9:51 am

/thread

first using a tool like hostbooter to hold a big net is the most stupid idea i have ever heard.

The botnet is widely used (almost no fud chances)

a ddos bot is usually not stable if not never

investing 35\$ to get a big net is a joke

Zeus cant be used without a totaly modification,that's mean some months of coding or spending a 1000\$ for a new version based on the old code,yes you may run a "5bot" zeus net,but you cant run something bigger,because of trackers and other shitt,even if you use a private pannel and refud deaily it will be money consuming especialy for a guy that want to use vertuxnet to get 100k

Zeus is good as a base,a code to lean from and make new bots

so please dont post your dreams about being a stupid guy,we cant handel that shitt even if it is only dreaming

@ op yes you may get a lot of bots, but that's a thing and managing the net is totally different thing ,just learn some shitt about networks ,a litel bit about malwars,then you will know what to choose

If you dont have the time, and you are a businessman rather than a "hacker/skid" then you need to spend money,get a partner and use the botnet for your plans, "seo shitt"

???

Download server and Buy Icrypt, crypt it everyday and be happy.

Io0oI You are only one man who is smart on HF , Also Gorhax.

I am sure this guy will never have big net , so 5-6k is normal for hostbooter . it will take down any websites he need. I am sure :)

/Thread

/soo))

???

DO YOU CALL THIS A STABLE SYSTEM ?

We are not talking about DDOSING websites,the important thing is

download/execute/update/
the more simple the bot,the more chances will not get easely detected,and the more stable your system will be
more code = more bugs = more "no stability"

crypting using an external crypter is not a good idea when runing a 6k net,you must know that.iCrypt is used by people like you that scan it in the wrong places ,so like I said "almost no fud chances"

This is why people buy bins for 600\$,something private,so they will not refud every day,and using an external crypter that could fuck't up the bin so "no stability"

do you understand what we mean by stability ?
BTW.you really look like the "ping pong system" guy

"Like you"

I am not using lcrypt, I am not scanning at virustotal.

P.s i use Private polymorphic crypting system at

www.styx-crypt.com ?

Starting from DLL and ending at .exe ?

Crypters are updating every 3 hours

You can get invite from me , but you need money to balance for crypt.

JS, HTML, EXE, DLL, SWF, PDF, IFrame;

for obusfication.

Also 5 times updating in day :)

lo0ol - November 27, 2011, 11:24 am

C&P from the website pub info,and post them as a dream

I dont get it .is it updated every 3 hours (8 times a day) or 5 time a day

any way
do you know what is polymorphism ?

(Nov 27, 2011 11:16 AM)I_am_DdoseR Wrote: [\[CITE\]](#) JS, HTML, EXE, DLL, SWF, PDF, IFrame;
for obfuscation.

exactly,you really dont,

polymorphism refers to self replicating it has nothing to do with obfuscation,you will get a totally different structure,almost a new variant,yes some guys obfuscat a code or crypt it and then call it a "full private legit polymorphic system",wish it is not.Adding some junk code or coding a crypting program has nothing to do with coding a self-crypting program.imagine making a machine that will execute one order and only one,and making a machine that can take decisions and execute different orders. It is totally different.this is why we call it polymorphic and not monomorphic

about the offer,no man,I 'll past ,I can do better things with that money

about the offer,no man,I 'll past ,I can do better things with that money

Yes i know what is polymorphism and this system works perfectly , never get detected .

?

Okay , bro .

Suhinder - November 27, 2011, 11:39 am

I'd go with an IRC botnet or an HTTP Botnet that's worth around \$500 - \$1000 if you're actually going to hold a large number of bots.

dfs - November 27, 2011, 12:13 pm

a good http bot with a good vps or dedi ive heard autumn is good just got to spend the money

g0dspeak - November 27, 2011, 12:19 pm

Jesus fucking christ. Are you serious? I bet you 99.9% of the "real hackers" Use IRC or HTTP protocol for their botnets, not their home motherfucking connections like your stupid ass, moronic self. I guess i'll see you in Federal Prison too then. Have fun getting fucked in the asshole by a 6' 4", 350lb black guy named Ted, I hope you enjoy his 14" cock.

You make up the "90% of HF skids".

Idiot, no one from serious hacker users IRC. IDIOT!

I said hackers use HTTP but it needs much more money for holding botnet on HTTP , Just read another messages and don't take message from context. Skid . ???????

It's better for hackforums member to use hostbooter and not own connection , vds / vps.

(Nov 27, 2011 10:18 AM)IniTiAlize Wrote: [\[CITE\]](#) Vertexloader it is Stable to hold slave? NO vertexloader blows its an unstable peice of shit. Try ubot its free but it still isnt very stable.. better then vertex though and proolly the best free one

Flowz - November 27, 2011, 2:13 pm

I have masturbate furiously to this thread, the ignorance and stupidity have blown my mind.

IRC is one of the MOST anonymous way of communicating through the internet. Trust me, hackers use IRC. After it's discovery, hackers fell in love with it and started to create malware compitable with it. Now the generation of centralized botnets are moving to HTTP for various reasons, as safety, costreducing and many other. As if we would apply the logic of "hostbooter" being a P2P-bot, then we could just say IRC, HTTP are P2P-protocols.. But nowadays malware using a (raw) TCP-socket to interference have given a whole new and wrong defenition to P2P. A bot using this TCP-socket technique as engine for the client and server to interference is the best (but it isn't a P2P-network). But for the botmaster to interference with the server would using HTTP be excellent as it provides a widely known and implmented protocol. It also has the ability to present some nice appeal for the eye.

TEAM UNKNOWN - November 27, 2011, 4:20 pm

try ubot it can hold 10k but it has no ddos so yahh if you want to ddos try Cythisia Botnet

Firstly raw TCP Socket? It will be TCP or UDP (and let the OS build the various headers for you), there is no advantage of using RAW Sockets.

Also what about companies that care about their network and block uncommon traffic? HTTP would be a better choice there.

Though with a custom protocol you do have more room for optimization.

Though with a custom protocol you do have more room for optimization.Well people call "hostbooter" a P2P-bot but I am almost certain that it's a centralized botnet. I see your point and it's

valid.

I've always had in mind that raw sockets were faster. True on that one but if a botnet were to be operated through HTTP, then the company would have blocked any site other than the ones they use. They would also analyse all the traffic even the HTTP-traffic.

All you have to do is retake the screenshot but include some of your browser in the shot (minus the

domain your shit is at) and then open a notepad up over it with your name written in.. Might also be good to show the time on your PC clock as well.. Unless you do that, you are a paki hecker pretending to run a net.
