Thread: [Problem with VB Keylogger/Keylogger builder](#)

McTittys - December 4, 2011, 11:27 pm

These are screen shots of the code for my builder, my keylogger is working im just trying to get the builder to work. The problem is whenever i use the builder and run the "Server.exe" that is created, it shows the error below...

Builder code:

Spoiler ([Click to View](#))

change your program to x86(32bit) or AnyCpu

How would I go about doing that??? Is there an option for it or a line of code??

ShadowCloud - December 5, 2011, 12:42 am

Check the project properties, you should be able to set the target cpu as mentioned above...

If you still can't get it, check this thread

<http://stackoverflow.com/questions/2147737/changing-a-visual-studio-c-sharp-project-from-x86-to-any-cpu>

Ethernal Five - December 5, 2011, 12:43 am

You can do that, or try and use codedom. Its like a stub inside your program. Its very easy to learn and better(imo) then this old method.

Yeppers, totally agreed that codedom would be a better way to go about it, I recall seeing a project that gets your source code from a txt file and then obfuscates all your code before the build is done... Not sure where it was though, but that would be a quite route to go on.

I hated it because you needed to dump everything in one text file and my projects are generally a bit more than one file, merging everything into one file was a huge nuisance, if anyone has adapted that to accept a solution folder, I'd be quite interested?

ihearyou - December 5, 2011, 1:28 am

The last error you are getting would be because ur av is detecting it as a virus there for it won't let you open it. I know AVG does this to me when i am coding keyloggers etc.

Fix the error with the processor and then turn off ur AV and see if it will run.

Cheers

I think thats possible using the command line parameters, not sure tho.

pindanootje - May 16, 2012, 12:57 am

how to fix it i got the same?

b4bb

tweety - May 16, 2012, 3:47 am

Most decent Obfuscators encrypt your resource files as well meaning your source will be protected. I'm not sure about the built server though.

Lambasoft - May 16, 2012, 4:10 am

Guys before building a Builder you should know these basic things !

Go to your project Properties and discover it yourself

colombotiger - May 31, 2015, 2:07 am

what is the work of command line parameters
