Thread: [\[TuT\] Complete Noob's Keylogger \[TuT\]](#)

UnEntitled - December 26, 2011, 8:00 am

I accidentally posted this in the Beginner section, but I think it belongs here. If an admin could remove the other one that'd be great.

We will be using Project Neptune. You can download Project Neptune for free at <http://project-neptune.net/>

Now, only download things like this from the official website. Like the one above. Don't worry, it isn't backdoored, this is the official website.

Note: This is only for the people just starting out, if you've already keylogged someone, this tutorial is not for you.

So, you're a complete newbie to this stuff. You open Project Neptune and you see this. You don't even know where to start. Relax, this is probably the easiest 'hack' you will ever learn.

Keystrokes

Log Settings

Now, the only thing that is all you need to edit is the time interval between log sending. I recommend NO SHORTER THAN 30 MINUTES. Why? Because you get too many logs and you might run out of email space.

Email Settings

So first, you're going to want to setup a gmail account. (If you're at the level of this tutorial, you shouldn't mess with FTP) So in the first section (Keystrokes) type in your Gmail username in the "Email to Send Keystroke Logs" and the "Email to Receive keystroke logs" and type in the password inside the password box.

Just to be safe, click "Test Email Account Information" If you typed everything in correctly, then it should alert you with a box

System Wide

Startup Settings

If you disable the task manager it will make your virus much harder to remove. However, your victim might be alerted and not log in to their accounts, which obviously is what you want.

Installation Directory

After execution, this is where the core process of your virus will move to.
I recommend either the Appdata folder OR the system32 folder.

Original File

If you really want that virus to stick, you're going to want to go with the "Delete/Melt" option. This option makes the virus immediately disappear on execution. However, your victim will most likely be very alarmed.

File Downloading

If this option is enabled, on execution of your virus, your victim's computer will automatically

download something else. (Whatever link you entered) A great way to spread multiple Botnets or RATs.

Extra Options

I personally think everything in this section is self explanatory. However if you still need help, shoot me a PM!

Server Creation

Server Settings

These are all option which may make your virus more realistic. If you enter some fake info making it look like some Microsoft operation you victim will most likely not remove it.

Server Creation

Now, just click "Generate New Server" and save it.

Your new server should appear in your Project Neptune directory. You're all set! Upload the virus to something like Megaupload and where that link out as much as possible! Now DON'T CLICK YOUR SERVER! This is very bad practice because you will spam your email with your OWN logs. Which waste your inbox space which could have been used for other people. If you strong need to test it, then run it under a Virtual Machine or use Sandboxie.

Oh, and don't mind the -1 rep. It was REALLY stupid.

TheCompressedMagnit - December 26, 2011, 6:20 pm

apparently the email don't work, because i type in a correct email and no use .

UnEntitled - December 27, 2011, 5:45 am

No offense, but I highly doubt that. Did you make sure you put your email in both boxes and put your password?

TheJester - December 27, 2011, 2:49 pm

What do I use as a Email SMPT Sending Server?

UnEntitled - December 27, 2011, 3:17 pm

(Dec 27, 2011 03:49 PM)TheJester Wrote: [\[CITE\]](#) What do I use as a Email SMPT Sending Server? If you use a Gmail account, leave it alone. If you use something like yahoo then simply google the SMPT server for it. I still recommend Gmail because it's just a better email site. ;D

TheJester - December 27, 2011, 4:02 pm

Alright, I got that. Now , I'm sorry if I sound a bit dumb as I am new to all this.

I got my E-mail working.

Is there a tutorial on this because I'm not sure how to send logs and stuff like that.

Just send it to people and if they execute it, it will automatically send you via email the logs of that person.

dirt81 - December 27, 2011, 4:39 pm

think once it is opened it automatically sends packets every 30 mins. i could be wrong im new too.

UnEntitled - December 27, 2011, 5:10 pm

Yeah, it's either 20 or 30 minutes between emails in the default setting. You could change it though.

? Death Disturbance ? - December 27, 2011, 5:12 pm

Couldnt you include some screenies? Link my Project Neptune tutorial? Also, I would change the title to something like 'Project Neptune TUT' or something like that..

I tried including screenies with imageshack but the error icon comes up. Don't know why.

TheJester - December 27, 2011, 5:44 pm

OK, I got the logs to run. Now how do I put an end to them?

UnEntitled - December 27, 2011, 6:06 pm

I said in the OP if you want to test it you should run it under a sandbox for easy termination. Since you didn't then just use your anti virus to remove it.

1n54n3 - January 25, 2012, 7:35 pm

Thanks for the tutorial.

Bro. do the victim need to install the .net framework to run the binded program (a keylogger and a file) ?
