Thread: [\[Q.\] HostBooting Botnets + Windows VPS](#)

proTWiiZ - February 11, 2012, 10:56 am

i gotta question, ive been searching on how you would use a windows vps and something like DDoSeR or (XR) HostbooeR on a windows VPS? i use a linux for irc's n stuff so i have sum knolege of them, but i dont really know how to withhostbooters. im thing of switching back to host booters, (maybe till' eyeBot release:plol) , mainly because i just want DDoS Holdtime + Download, Execute, Update (>what do you guys reccomend for those??<)

but anyways, how would i do thsi? i would like to have all bots connected to vps, but then be able to use the client (and have all bots showup) like u would with direct p2p. i dont like how easily it can be backtracked, and how they will always be connected directly to you, so is a windows vps the best for this?, and how would I be able to do this? thanks<3 im sure this wil help alot out aswell!

-typed from my phone;p

i see you wanna use a VPS and all but have you ever tired just a VPN would save you a lot of time an im sure a VPN would be cheaper then a VPS.

Whis is more secure? and how would i hold the bots on a vpn? i think a vps would be better for it, cause i dont want the bots connected to my network, thats why i liked http & irc's on vps'. so would they be under my connection? cause ik windows has 999 socks limit or sumthn, so a windows vps would aslo be required right? lolidk:o

Anyone else have more infos? like diff methods so its not on my pc?
